Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q21-Q26):

NEW QUESTION # 21

A Salesforce administrator asks for advice on how to build their Salesforce flow. They need to complete several DML actions as part of their Salesforce flow and are running into DML governor limits during testing.

Which two pieces of advice should be given to the Salesforce administrator to improve their flow? (Choose two.)

- A. Use DML statements at the end of the flow wherever possible.
- B. Loop through a collection variable to save more records with a single DML statement.
- C. Use the upsert action to reduce the amount of DML statements required during the flow runtime.
- D. Avoid putting DML statements inside of For Loop occurrences.

Answer: B,D

Explanation:

Avoid DML in For Loops: Placing DML (Data Manipulation Language) operations inside a loop can quickly exceed Salesforce governor limits, as each iteration performs a separate DML operation. It's best to collect records in a list and perform DML operations outside the loop.

Reference: Salesforce Governor Limits

Use Collection Variables: By looping through a collection variable and adding records to it, you can perform bulk DML operations, which are more efficient and less likely to hit governor limits.

Reference: Apex Collections and Bulk Processing

Use Upsert Action: Using the upsert action can reduce the number of DML statements by combining insert and update operations. However, this strategy depends on the specific flow requirements and data structure.

Reference: Salesforce Upsert Operation

DML Statements at the End: Consolidating DML operations to the end of the flow is advisable, but care should be taken to handle errors and exceptions appropriately.

NEW QUESTION # 22

Northern Trail Outfitters is building a hyperautomation solution using Salesforce and MuleSoft. They need to use Salesforce Flow to automate a multi-departmental process in an external system and capture the outcome in Salesforce.

How should the Salesforce Flow solution be structured to meet this requirement?

- **A. A Flow Orchestration to automate the multi-departmental process and update Salesforce records**
- B. Parent and subflows invoked by REST API to capture user inputs and update Salesforce records
- C. An evaluation flow which evaluates when the process is completed and updates Salesforce records
- D. An autolaunched flow invoked by REST API to update Salesforce after the process is completed

Answer: A

Explanation:

Salesforce Flow Orchestration is designed to manage complex, multi-step business processes that span multiple departments and systems. Here's how it can be structured to meet the requirement:

Automate Multi-Departmental Process:

Use Flow Orchestration to define and manage the steps involved in the multi-departmental process. It allows you to break down the process into stages and define the sequence of actions and approvals required.

Capture Outcome in Salesforce:

After completing the external process, Flow Orchestration can be configured to update Salesforce records with the outcome. This ensures that the results of the automated process are reflected within Salesforce.

Orchestration Capabilities:

Salesforce Flow Orchestration provides features such as task assignments, decision elements, and complex branching logic, which are ideal for managing multi-departmental workflows.

NEW QUESTION # 23

AnyAirlines is developing an RPA process and is implementing testing best practices. They want to take the RPA process through rigorous testing.

During these tests, where do RPA process test plans execute?

- A. In RPA Builder
- B. In an RPA process runtime
- **C. On a configured RPA Bot**
- D. In RPA Manager

Answer: C

Explanation:

During testing of an RPA process, test plans are executed on a configured RPA Bot. This allows you to simulate real-world scenarios and ensure the RPA process works correctly under various conditions:

On a Configured RPA Bot:

RPA Bots are configured to execute the automated tasks defined in the RPA process. By running test plans on these bots, you can

verify the functionality and performance of the RPA process.

This approach ensures that the RPA process is thoroughly tested in an environment that closely mirrors production conditions.

NEW QUESTION # 24

AnyAirlines wants to create a new marketing campaign that sends customers special offers every month based on their accrued loyalty points. There is an existing integration for customer data using MuleSoft's API-led three-tier strategy. Loyalty information exists in an external system that can be accessed via an HTTP endpoint provided by the system, but has no current integration. The external ID used will be email address.

The desired output is a CSV file containing customers that includes only the top 10 percent of loyalty point holders.

What is the most efficient way to meet this requirement?

- A. 1. Create a Salesforce Flow that retrieves the Contact data.2. Create a Salesforce Flow that retrieves the Loyalty data.3. Create a Flow Orchestration that uses the two flows and outputs the result to a CSV file.
- B. 1. Have the MuleSoft team develop a new integration that includes a new System API to both the Customer and Loyalty systems.2. Create a Process API to output the final results.3. Create an Experience API for the business consumers to initiate the integration.
- C. 1. Create a MuleSoft Composer flow that utilizes the current Customer integration to select all customers.2. Create an additional MuleSoft Composer flow that retrieves all the Loyalty information.3. Create a MuleSoft Composer flow that combines the two previous results and outputs the top 10 percent to a CSV file.
- D. 1. **Have the MuleSoft team develop a new integration that includes a System API to the Loyalty system and uses the existing Customer System API.**2. Create a Process API to output the final results.3. Create an Experience API for the business consumers to initiate the integration.

Answer: D

Explanation:

Develop System API for Loyalty System: The first step is to develop a new System API that integrates with the Loyalty system. This API will handle communication with the external system via the provided HTTP endpoint.

Reference: MuleSoft API-led Connectivity

Utilize Existing Customer System API: Use the existing System API for customer data to retrieve necessary customer information. Combining these APIs ensures a modular approach and reuse of existing assets.

Reference: API-led Connectivity

Create Process API: Develop a Process API that combines data from both the Customer and Loyalty System APIs. This API will process the data, apply business logic to filter the top 10 percent of loyalty point holders, and format the results.

Reference: Designing Process APIs

Create Experience API: Develop an Experience API to serve the business consumers. This API will provide a user-friendly interface for initiating the integration and retrieving the results as a CSV file.

Reference: API Experience Layer

NEW QUESTION # 25

Northern Trail Outfitters is developing an API that connects to a vendor's database.

Which two strategies should their Ops team use to monitor the overall health of the API and database using API Functional Monitoring? (Choose two.)

- A. **Make a call to a health-heck endpoint, and then verify that the endpoint is still running.**
- B. Monitor the Mule worker logs for "ERROR" statements and verify that the results match expected errors.
- C. **Make a GET call to an existing API endpoint, and then verify that the results match expected data.**
- D. Monitor the CloudHub worker logs for JDBC database connection exceptions.

Answer: A,C

Explanation:

Health-Check Endpoint: Creating and regularly calling a health-check endpoint is a common strategy to ensure that the API and its underlying systems are operational. This endpoint typically performs basic checks such as database connectivity and service availability.

Reference: Health Check Pattern

GET Call to Existing Endpoint: Making a GET call to an existing API endpoint and verifying that the results match expected data

helps ensure that the API is not only running but also functioning correctly. This approach validates that the API can retrieve data from the database as intended.

Reference:API Monitoring Best Practices

Monitoring CloudHub Worker Logs:While monitoring logs can be useful, it is more of a reactive approach.

Proactive strategies like health-check endpoints and GET calls provide immediate validation of the API's operational status.

Reference:CloudHub Monitoring

Verifying Mule Worker Logs for Errors:This approach can complement health-check endpoints and GET calls but should not be the primary strategy. Logs are helpful for diagnosing issues after they occur rather than ensuring ongoing health.
