Most experts agree that the best time to ask for more dough is after you feel your C_CPI_2506 performance has really stood out. To become a well-rounded person with the help of our C_CPI_2506 study questions, reducing your academic work to a concrete plan made up of concrete actions allows you to streamline and gain efficiency, while avoiding pseudo work and guilt. Our C_CPI_2506 Guide materials provide such a learning system where you can improve your study efficiency to a great extent.

SAP C_CPI_2506 Exam Syllabus Topics:

Topic	Details
Topic 1	• SAP Event Mesh: This section of the exam measures the skills of Solution Architects and centers on using SAP Event Mesh to support event-driven integration. It highlights the importance of asynchronous communication, event publishing, and subscription models, allowing organizations to build scalable and decoupled systems.
Topic 2	• Managing APIs: This section of the exam measures the skills of Solution Architects and focuses on managing APIs within the SAP ecosystem. It covers topics such as API provisioning, lifecycle management, security policies, and monitoring, ensuring candidates can handle APIs effectively for enterprise integration needs.
Topic 3	• Implementing Cloud Integration: This section of the exam measures the skills of Integration Consultants and examines how cloud integration flows are designed and deployed. It emphasizes creating integration scenarios, handling connectivity, and applying best practices to build efficient, secure, and reliable integration processes in SAP's cloud environment.

Topic 4	• SAP Integration Suite Overview: This section of the exam measures the skills of Integration Consultants and covers the foundational concepts of the SAP Integration Suite. It provides an understanding of the suite's capabilities, its role in connecting applications, and its relevance in modern cloud-based integration scenarios.

C_CPI_2506 Updated resource Vce Files exam topics

Closed cars will not improve, and when we are reviewing our qualifying examinations, we should also pay attention to the overall layout of various qualifying examinations. For the convenience of users, our C_CPI_2506 learning materials will be timely updated information associated with the qualification of the home page, so users can reduce the time they spend on the Internet, blindly to find information. Our C_CPI_2506 Learning Materials get to the exam questions can help users in the first place, and what they care about the test information, can put more time in learning a new hot spot content.

SAP Certified Associate - Integration Developer Sample Questions (Q50-Q55):

NEW QUESTION # 50

What is Representational State Transfer (REST)?

- A. A description language for APIs
- **B. An architectural style**
- C. A message protocol
- D. An application protocol

Answer: B

Explanation:

REST (Representational State Transfer) is:

An architectural style for designing networked applications.

Based on principles such as statelessness, resource orientation, uniform interface (HTTP methods: GET, POST, PUT, DELETE).

Used widely in SAP (OData is REST-based).

Other options:

Not a protocol (like HTTP), not a description language (like OpenAPI), and not limited to messaging.

Correct definition # Architectural style.

NEW QUESTION # 51

Which part of the proxy URL is provided by the initial configuration step of the API Management?

- **A. Virtual host**
- B. Version
- C. Name of the API management
- D. Service name

Answer: A

Explanation:

To set up the API Management capability within SAP Integration Suite, you must provide a virtual host as part of the initial configuration step. The virtual host is a host alias that identifies your organization and is used as the base URL of your API proxies.

For example, if your virtual host is myorg, your API proxy URL will look like this:

<https://myorg.apimanagement.hana.ondemand.com/<api-name>>. The virtual host can be changed later in the API portal settings.

Reference: Setting Up API Management Capability | SAP Help Portal, Virtual Hosts | SAP Help Portal

NEW QUESTION # 52

How do you configure a SOAP adapter for asynchronous processing?

- A. Message Exchange Pattern: Request-Reply. Process Settings: WS Standard
- B. Message Exchange Pattern: One-Way. Process Settings: WS Standard
- **C. Message Exchange Pattern: One-Way. Process Settings: Robust**
- D. Message Exchange Pattern: Request-Reply. Process Settings: Robust

Answer: C

Explanation:

For asynchronous processing in a SOAP adapter (SAP Cloud Integration):

Use Message Exchange Pattern = One-Way # Indicates no response is expected.

Choose Process Settings = Robust # Ensures message reliability and error handling in async flows.

Other combinations:

Request-Reply # Used for synchronous scenarios, not async.

WS Standard # Not the correct configuration for async reliability in CPI SOAP adapter.

Thus, correct async configuration is: One-Way + Robust.

NEW QUESTION # 53

To receive the "sap/s4/beh/businesspartner/va/BusinessPartner/Changed/v1" business event from SAP S/4HANA Cloud in SAP Integration Suite Event Mesh, which components are required to construct the Topic Subscription string?

- **A. Namespace Topic name Separator.**
- B. Business Partner ID Change type Event timestamp
- C. API key Authentication token Client ID
- D. Source system Target system Integration flow

Answer: A

Explanation:

In SAP Event Mesh, topic subscriptions follow a defined hierarchical string structure:

Namespace # Defines the domain or context (e.g., sap/s4/beh/businesspartner).

Topic name # Specifies the exact event (e.g., BusinessPartner/Changed).

Separators (/) # Used to concatenate namespace and event details into a full subscription string.

Other options:

API key, Client ID, and Authentication token # Used for connectivity but not part of the topic string.

Business Partner ID, Change type, Event timestamp # Payload details, not part of the subscription string.

Source/Target system # Not required for constructing the topic name.

Thus, the correct components are Namespace, Topic name, Separator.

NEW QUESTION # 54

What do you use in an integration flow to handle unexpected errors?

- A. Status code checks
- **B. Exception-handling subprocesses**
- C. Exception handler integration flow elements
- D. Try-catch subprocesses

Answer: B

Explanation:

You use exception-handling subprocesses in an integration flow to handle unexpected errors. Exception-handling subprocesses are special types of subprocesses that are triggered when an error occurs in the main process or another subprocess. You can define custom actions and logic to handle different types of errors using exception-handling subprocesses. Reference: Modernize Integration with SAP Integration Suite | openSAP
