

# Test NCP-DB King, NCP-DB Free Exam Dumps

BONUS!!! Download part of CertkingdomPDF NCP-DB dumps for free: [https://drive.google.com/open?id=130saP3X\\_d84Gy9h-qigJZqRVTq6D7HRd](https://drive.google.com/open?id=130saP3X_d84Gy9h-qigJZqRVTq6D7HRd)

The CertkingdomPDF is committed to ace your Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 (NCP-DB) exam preparation and ensure your success on the first attempt. To achieve this objective the CertkingdomPDF is offering top-rated, real, and updated Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 (NCP-DB) exam questions in three different formats. The names of these formats are NCP-DB PDF dumps file, desktop practice test software, and web-based practice test software.

You can get the downloading link and password within ten minutes after payment. Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 NCP-DB exam dumps contain both questions and answers, and it's convenient for you to check your answers. Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 NCP-DB training materials are high-quality and high accuracy, since we are strict with the quality and the answers. We ensure you that NCP-DB Exam Dumps are available, and the effectiveness can be also guarantees.

## NCP-DB Free Exam Dumps | Official NCP-DB Practice Test

We do admire our experts' familiarity and dedication with the industry all these years. By their help, you can qualify yourself with NCP-DB guide materials. Our experts pass onto the exam candidate their know-how of coping with the exam by our NCP-DB Exam Braindumps. Exam candidates are susceptible to the influence of ads, so our experts' know-how is impressive to pass the NCP-DB exam instead of making financial reward solely.

## Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 Sample Questions (Q43-Q48):

### NEW QUESTION # 43

Which port should be opened to ensure the NDB server, NDB agent, and NDB database agent can communicate with the registered cluster via REST API calls?

- A. 0
- B. 1
- C. 2
- **D. 3**

**Answer: D**

Explanation:

To ensure the NDB server, NDB agent, and NDB database agent can communicate with the registered cluster via REST API calls, port 2009 must be opened. This port is used by NDB components to facilitate RESTful communication with the Nutanix cluster (e.g., Prism Element or Prism Central) for operations such as provisioning, monitoring, and management. Proper firewall configuration to allow traffic on this port is a prerequisite for NDB's integration with the cluster.

Other options are incorrect:

- \* B. 3205: Not a standard NDB port; used for other Nutanix services.
- \* C. 3260: Associated with iSCSI, not REST API communication.
- \* D. 9440: Used for Prism Element's HTTPS management interface, not NDB-specific REST calls.

Thus, the verified answer is A, reflecting NDB's REST API requirements.

#### NEW QUESTION # 44

A Development team is asking for updated data for a cloned MongoDB instance that is being used as source data for a script. Which task should be performed by an NDB administrator?

- **A. Run a Clone refresh.**
- B. Provision a MongoDB instance.
- C. Execute a clone update.
- D. Clone the DB from the latest point in time data.

**Answer: A**

Explanation:

A Development team requesting updated data for a cloned MongoDB instance used as source data for a script needs the latest snapshot or point-in-time data. In NDB, the "Clone Refresh" task updates an existing clone with the most recent data from the source database, ensuring the development team has access to current information without recreating the clone. This is the most efficient approach for maintaining an updated clone.

- \* Option A (Clone the DB from the latest point in time data) is incorrect because it creates a new clone, duplicating effort instead of refreshing the existing one.
- \* Option B (Execute a clone update) is incorrect as "clone update" is not a standard NDB task; refresh is the correct term.
- \* Option C (Provision a MongoDB instance) is incorrect because it provisions a new instance, not an update to the clone.
- \* Option D is correct as Clone Refresh syncs the clone with the latest source data.

#### NEW QUESTION # 45

What is the most efficient way to get information on REST APIs for a task in Era?

- A. Log into Era VM and run to list all the REST APIs.
- B. Navigate to Swagger REST in Era GI-II.
- C. Navigate to and look for the desired
- **D. use API equivalent button in a workflow.**

**Answer: D**

Explanation:

This is because it allows the database to be refreshed at the exact time specified (9:30 PM) with the most recent data. The other options either perform the snapshot before the desired time or do not specify when the snapshot would occur. Please note that the exact answer might depend on the specific database system and its capabilities. Always refer to the database's documentation for the most accurate information.

**NEW QUESTION # 46**

Within the NDB GUI, an administrator needs to set the shortest schedule interval possible for a database log catch up. Which value, in minutes, will satisfy this requirement?

- A. 0
- B. 1
- C. 2
- **D. 3**

**Answer: D**

Explanation:

The NDB GUI allows an administrator to set the schedule interval for a database log catch up, which is the process of collecting transaction logs periodically from the source databases and storing them in the time machine. The shortest possible value for this interval is 15 minutes, as per the NDB documentation<sup>1</sup>. This means that the NDB time machine will capture the database logs every 15 minutes and use them for backup, restore, clone, and refresh operations. References: Nutanix Database Management & Automation (NDMA), page 29; Nutanix Support & Insights, section "Log Catch-up"

**NEW QUESTION # 47**

An administrator tried to provision Nutanix Database Service (NDB) from Prism Central Marketplace and is getting the error shown in the exhibit.

Which action would have prevented this issue?

- A. Register NDB using the correct IP address.
- **B. Configure an IP address when deploying the application.**

- C. Import the proper image in the Prism Central.
- D. Provide a subnet with IP Address Management

**Answer: B**

Explanation:

The exhibit shows an error during the provisioning of NDB from the Prism Central Marketplace, with a failure reason stating "IP not found" in the "EraService - Substrate Create" step. This indicates that the provisioning process could not assign or detect an IP address for the NDB instance, likely due to an unconfigured or missing IP address during deployment. To prevent this issue, the administrator should configure an IP address when deploying the application. This involves specifying a static IP or ensuring IP Address Management (IPAM) is properly set up to allocate an IP during the Prism Central Marketplace deployment wizard.

Other options are less directly relevant:

- \* B. Import the proper image in the Prism Central: This ensures the correct NDB image is available but does not address the IP assignment issue.
- \* C. Provide a subnet with IP Address Management: While useful, this is a broader configuration step and not the specific action needed during deployment.
- \* D. Register NDB using the correct IP address: Registration occurs after deployment and does not prevent the initial IP assignment failure.

Thus, the verified answer is A, as configuring the IP address during deployment directly addresses the "IP not found" error.
