

F5CAB3 Certification Dumps, F5CAB3 Study Demo

Our F5CAB3 exam materials are formally designed for the exam. With its help, you don't have to worry about the exam any more for it almost guarantees you get what you want. If you think I'm exaggerating, you might as well take a look at our F5CAB3 Actual Exam. With a high pass rate as 98% to 100%, you will be bound to pass the exam. And our F5CAB3 training questions are popular in the market. We believe you will make the right choice.

If you are preparing for the exam in order to get the related certification, here comes a piece of good news for you. The F5CAB3 guide torrent is compiled by our company now has been praised as the secret weapon for candidates who want to pass the F5CAB3 exam as well as getting the related certification, so you are so lucky to click into this website where you can get your secret weapon. Our reputation for compiling the best F5CAB3 Training Materials has created a sound base for our future business. We are clearly focused on the international high-end market, thereby committing our resources to the specific product requirements of this key market sector. There are so many advantages of our F5CAB3 exam torrent, and now, I would like to introduce some details about our F5CAB3 guide torrent for your reference.

F5CAB3 Study Demo & Cost Effective F5CAB3 Dumps

F5 F5CAB3 certification is indeed a better idea before you start with the interviews. F5 F5CAB3 certification will add up to your excellence in your field and leave no space for any doubts in the mind of the hiring team. But, have you thought about how can you prepare for the F5 F5CAB3 Exam Questions? Do you have any idea how we can crack the nut to give wings to our dreams?

F5 BIG-IP Administration Data Plane Configuration Sample Questions (Q28-Q33):

NEW QUESTION # 28

A Standard Virtual Server reports poor performance for Internet users.
What TCP profile configuration should be applied?

- A. Client: f5-tcp-lan
- B. Client: f5-tcp-lan / Server: f5-tcp-wan
- C. Client: f5-tcp-optimized
- D. Client: f5-tcp-wan / Server: f5-tcp-lan

Answer: D

Explanation:

WAN-optimized TCP profiles improve performance for high-latency Internet clients, while LAN profiles are optimal for backend servers.

NEW QUESTION # 29

What is the status of a pool member when manual resume is enabled and a health check first fails and then passes?

- A. Available (Enabled)
- B. Available (Disabled)
- C. Offline (Enabled)
- **D. Offline (Disabled)**

Answer: D

Explanation:

With manual resume enabled, BIG-IP does not automatically return a pool member to service after recovery. The member remains offline until manually re-enabled.

NEW QUESTION # 30

An LTM device has a virtual server mapped to www.f5.com with a pool assigned. The objects are defined as follows: Virtual server: Destination 192.168.245.100:443 netmask 255.255.255.0. Persistence: Source address persistence netmask 255.0.0.0. SNAT: Automap. Profiles: HTTP/TCP. How should the BIG-IP Administrator modify the persistence profile so that each unique IP address creates a persistence record?

- A. netmask 255.255.255.0
- **B. netmask 255.255.255.255**
- C. netmask 255.255.0.0
- D. netmask 0.0.0.0

Answer: B

Explanation:

Source Address Affinity (Persistence) works by tracking the source IP address of incoming packets to ensure a client stays connected to the same backend server. The "netmask" setting within the persistence profile determines the "granularity" of this tracking. A netmask tells the BIG-IP how many bits of the source IP address to ignore when creating the persistence record. For example, the current setting of 255.0.0.0 (a /8 mask) means the BIG-IP only looks at the first octet of the IP; this results in all users from the same large Class A network (e.g., everyone from 10.0.0.0 to 10.255.255.255) being persisted to the exact same server, which can lead to severe load imbalance.

To ensure that each unique IP address creates its own individual persistence record, the administrator must set the netmask to 255.255.255.255 (for IPv4). This is a "host mask" or /32, which instructs the BIG-IP to evaluate all 32 bits of the client's source IP address. With this setting, 10.1.1.1 and 10.1.1.2 will be treated as distinct entities and can be load balanced to different servers, each maintaining their own "stickiness". While Option A (255.255.255.0) would group users by their local subnet, only the full 255.255.255.255 mask satisfies the requirement for true unique-IP persistence. This configuration is standard for internet-facing applications where users arrive from diverse locations and the administrator wants to maintain the most granular and balanced distribution of traffic possible.

NEW QUESTION # 31

A virtual server is configured to offload SSL from a pool of backend servers. When users connect to the virtual server, they successfully establish an SSL connection but no content is displayed. A packet trace performed on the server shows that the server receives and responds to the request. What should a BIG-IP Administrator do to resolve the problem? (Choose one answer)

- A. disable Server SSL profile
- **B. enable SNAT**
- C. enable Server SSL profile
- D. disable SNAT

Answer: B

Explanation:

This scenario describes a classic case of asymmetric routing in a "one-arm" or non-gateway deployment.

When a BIG-IP system is configured for SSL offloading, the following traffic flow occurs:

* Client-Side: The client establishes a successful SSL/TLS handshake with the Virtual Server. This explains why the user can "successfully establish an SSL connection."

* Server-Side: The BIG-IP decrypts the traffic and forwards it as plain HTTP to the backend server. The packet trace confirms the

server receives the HTTP GET request and responds with the content.

* **The Routing Failure:** By default, the BIG-IP system preserves the client's original source IP address. If the backend server's default gateway is not the BIG-IP system (or if the server is on the same subnet as the client), the server will attempt to send the response directly back to the client's IP address, bypassing the BIG-IP.

* **Stateful Drop:** Because the BIG-IP is a Full Proxy, it expects the response to return through its own internal state table to be encrypted and sent back to the client. Since the response bypasses the BIG-IP, the BIG-IP connection eventually times out, and the client receives no data despite the server having sent it.

Solution (SNAT): Enabling Secure Network Address Translation (SNAT), specifically SNAT Auto Map, ensures that the BIG-IP replaces the client's source IP with its own internal self-IP before sending the request to the server. This forces the server to send the response back to the BIG-IP, allowing the BIG-IP to complete the transaction and deliver the content to the user.

NEW QUESTION # 32

Users are unable to reach an application. The Virtual Server shows a red diamond status.

What is the cause?

- A. Pool members disabled
- B. HTTPS traffic sent to HTTP VS
- C. Virtual Server disabled
- **D. All pool members are down**

Answer: D

Explanation:

A red diamond indicates that the Virtual Server is enabled but unavailable, typically due to all pool members being down.

NEW QUESTION # 33

.....

There are three different versions of our F5CAB3 study guide which are PDF, Software and APP online versions. For their varied advantages, our F5CAB3 learning questions have covered almost all the interests and habits of varied customers groups. No matter you are a student, a working staff, or even a house wife, you will find the exact version of your F5CAB3 Exam Materials to offer you a pleasant study experience.
