P.S. Free & New CDCS dumps are available on Google Drive shared by 2Pass4sure: <https://drive.google.com/open?id=151zJSf0DewRymg8rc2KfrDSpMA7ZFUQ3>

Holding a EXIN EPI Certified Data Centre Specialist CDCS Certification in a certain field definitely shows that one have a good command of the CDCS knowledge and professional skills in the related field. However, it is universally accepted that the majority of the candidates for the EXIN EPI Certified Data Centre Specialist exam are those who do not have enough spare time and are not able to study in the most efficient way.

Challenge is omnipresent like everywhere. By eliciting all necessary and important points into our CDCS practice materials, their quality and accuracy have been improved increasingly, so their quality is trustworthy and unquestionable. There is a bunch of considerate help we are willing to offer. Besides, according to various predispositions of exam candidates, we made three versions for your reference. Untenable materials may waste your time and energy during preparation process.

Maybe life is too dull; people are willing to pursue some fresh things. If you are tired of the comfortable life, come to learn our CDCS exam guide. Learning will enrich your life and change your views about the whole world. Also, lifelong learning is significant in modern society. Perhaps one day you will become a creative person through your constant learning of our CDCS Study Materials. And with our CDCS practice engine, your dream will come true.

## EXIN EPI Certified Data Centre Specialist Sample Questions (Q100-Q105):

### NEW QUESTION # 100

When installing a raised floor, can we use a spirit level bar to level the floor?

- A. Yes, spirit level bars can be used as long as their length is longer than 60 cm/2 ft (the size of a typical raised floor tile).
- B. Yes, but spirit level bars can only be used in the vertical plane.

- C. Yes, using a spirit level bar for raised floors higher than 40 cm is preferred.
- D. No, because using a spirit level bar, a measurement error will be transferred from pedestal to pedestal.

**Answer: D**

Explanation:

A spirit level bar should not be used for leveling a raised floor, as measurement errors are likely to propagate from one pedestal to the next. Spirit levels can introduce cumulative errors, leading to uneven floors, particularly in large installations where precise leveling is critical.

Detailed Explanation:

Using a laser level or a precision leveling device is recommended to ensure accuracy across all floor tiles. Spirit levels, while adequate for short spans, can transfer small inaccuracies from one pedestal to another, which can cause alignment issues and floor instability over time.

EPI Data Center Specialist References:

EPI data center guidelines discourage the use of spirit levels for raised floors. Instead, they advocate for precision tools like laser levels that ensure consistency and accuracy in large-scale installations, aligning with best practices for raised floor construction.

### NEW QUESTION # 101

In order to save energy, you are going to install an automated system to switch off lights. What should be taken into consideration when installing such a system?

- A. It is not advisable to use such a system since it will reduce the lifetime of LED lighting.
- B. At all times, the levels should allow for security cameras to function properly.
- C. Security guards should perform regular inspections verifying the system works.
- D. The system should not be based on motion detection as the lights might suddenly switch off while staff is still at work.

**Answer: B**

### NEW QUESTION # 102

EMF shielding material needs to be installed as EMF levels from the transformer room into the computer room are measured at 100 mG. The transformer room is ~10 meters away, separated by a corridor. Where should shielding be installed?

- A. As close as possible to the computer room
- B. As close as possible to the transformer room
- C. It does not matter; either close to the transformer room or computer room is okay
- D. Shielding is not required as 100 mG is within acceptable levels

**Answer: B**

Explanation:

The most effective EMF mitigation is to install shielding as close as possible to the source of radiation. By blocking or redirecting magnetic flux at the origin (the transformer room walls), the overall field propagation into adjacent areas is minimized. If shielding were placed at the computer room, the field would already have spread over the intervening space, requiring more material and higher cost.

Standards such as IEEE Std 299 (EMC Shielding Effectiveness) and IEC 61000 emphasize source-based mitigation. Additionally, ANSI/TIA-942 requires EMF shielding where magnetic flux exceeds recommended ICT thresholds (generally <5 mG for sensitive tape/disk storage).

Although 100 mG is often tolerated by modern equipment, legacy magnetic storage can be affected, so shielding is still prudent. Hence, the correct location is at the transformer room wall.

### NEW QUESTION # 103

What is needed to determine the Relative Humidity (RH)?

- A. Cold surface with dew collection counter
- B. Dry bulb temperature, wet bulb temperature, and psychrometric chart
- C. Wet bulb temperature, local atmospheric pressure, and calculator
- D. Dry bulb temperature, airflow, and conversion table

**Answer: B**

Explanation:

Relative Humidity (RH) is defined as the ratio of the actual water vapor content in the air to the maximum possible water vapor content at a given temperature. To calculate RH:

\* Dry bulb temperature (DBT): the ambient air temperature.

\* Wet bulb temperature (WBT): the temperature measured by a thermometer covered with a wet wick, influenced by evaporative cooling.

Using DBT and WBT, the humidity ratio and dew point can be determined with a psychrometric chart or Mollier diagram. From there, RH is calculated as:

Options A and B are incomplete, while option C is an experimental method, not standard practice. The recognized method is option D.

#### NEW QUESTION # 104

In which stage of the data center life cycle does testing and commissioning take place?

- **A. Implement stage**
- B. Design stage
- C. Operate/optimize stage
- D. Retire stage

**Answer: A**

Explanation:

The data center life cycle is typically divided into four stages:

\* Design (scope, architecture, planning)

\* Implement (construction, installation, testing & commissioning)

\* Operate/Optimize (day-to-day operations, maintenance, continuous improvement)

\* Retire (decommissioning and migration)

Testing and commissioning occur in the Implement stage, after construction but before handover. This includes Integrated Systems Testing (IST), which validates that all systems (electrical, cooling, fire protection, telecom) perform to design intent and redundancy requirements.

Without commissioning, the data center cannot be certified or considered operational.
