Mule-Dev-202 Valid Braindumps Free & Mule-Dev-202 Mock Exams

The Salesforce Certified MuleSoft Hyperautomation Developer (Mule-Dev-202) examination is necessary for career advancement, therefore, doing your best to prepare for the Salesforce Certified MuleSoft Hyperautomation Developer (Mule-Dev-202) certification exam is essential. To succeed on the Salesforce Certified MuleSoft Hyperautomation Developer (Mule-Dev-202) exam, you require a specific Salesforce Certified MuleSoft Hyperautomation Developer (Mule-Dev-202) exam environment to practice. But before settling on any one method, you make sure that it addresses their specific concerns about the Mule-Dev-202 Exam, such as whether or not the platform they are joining will aid them in passing the Salesforce Certified MuleSoft Hyperautomation Developer (Mule-Dev-202) exam on the first try, whether or not it will be worthwhile, and will it provide the necessary Mule-Dev-202 Questions.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q61-Q66):

NEW QUESTION # 61

AnyAirlines uses an Einstein bot for their customer support. They want it to display a message when a user provides an incorrect answer to a particular question.

Which dialog option should be selected'?

- A. Action
- **B. Message**
- C. Question
- D. Rules

Answer: B

Explanation:

Message Dialog Option:When configuring an Einstein bot to respond to incorrect answers, the 'Message' dialog option should be selected. This allows the bot to display a predefined message to the user, guiding them appropriately or informing them of the incorrect input.

Reference:Salesforce Einstein Bot Setup Guide

Understanding Dialog Options:

Action:Used for initiating backend processes or external actions.

Question:Used for asking the user for information or inputs.

Rules:Used for defining conditional logic to control the flow of the conversation.

Message:Specifically used to provide information or feedback to the user, which is ideal for handling incorrect answers.

Reference:Einstein Bots Dialogue Management

NEW QUESTION # 62

AnyAirlines has MuleSoft Composer installed on their production Salesforce environment.

To test flows with data in multiple non-production environments, what does the hyperautomation specialist need to do?

- **A. Create a connection to each of the non-production environments within the Composer UI.**
- B. Install MuleSoft Composer in only one non-production Salesforce environment and create a proxy to all other non-production environments.
- C. Install MuleSoft Composer in each of the non-production Salesforce environments.
- D. Use mocked data because non-production data is not available to MuleSoft Composer.

Answer: A

Explanation:

Create Connections:To test flows with data in multiple non-production environments, creating connections to each environment within the MuleSoft Composer UI is necessary. This allows the Composer to access and manipulate data across different environments, ensuring comprehensive testing.

Reference:MuleSoft Composer Connections

Installing Composer in Non-Production Environments:While installing Composer in each environment is technically possible, creating individual connections is more efficient and aligns with best practices.

Reference:Composer Setup and Configuration

Using Mocked Data:Mocked data can be useful for initial testing, but connecting to actual non-production environments provides more realistic test scenarios.

Reference:Testing with Mock Data

Proxy Setup:Creating a proxy to other environments is complex and unnecessary when Composer supports direct connections.

Reference:Proxy Configuration

NEW QUESTION # 63

AnyAirlines wants to create a new marketing campaign that sends customers special offers every month based on their accrued loyalty points. There is an existing integration for customer data using MuleSoft's API-led three-tier strategy. Loyalty information exists in an external system that can be accessed via an HTTP endpoint provided by the system, but has no current integration. The external ID used will be email address.

The desired output is a CSV file containing customers that includes only the top 10 percent of loyalty point holders.

What is the most efficient way to meet this requirement?

- A. 1. Create a MuleSoft Composer flow that utilizes the current Customer integration to select all customers.2. Create an additional MuleSoft Composer flow that retrieves all the Loyalty information.3. Create a MuleSoft Composer flow that combines the two previous results and outputs the top 10 percent to a CSV file.
- B. 1. Create a Salesforce Flow that retrieves the Contact data.2. Create a Salesforce Flow that retrieves the Loyalty data.3. Create a Flow Orchestration that uses the two flows and outputs the result to a CSV file.
- C. 1. Have the MuleSoft team develop a new integration that includes a System API to the Loyalty system and uses the existing Customer System API.2. Create a Process API to output the final results.3. Create an Experience API for the business consumers to initiate the integration.
- D. 1. Have the MuleSoft team develop a new integration that includes a new System API to both the Customer and Loyalty systems.2. Create a Process API to output the final results.3. Create an Experience API for the business consumers to initiate the integration.

Answer: C

Explanation:

Develop System API for Loyalty System:The first step is to develop a new System API that integrates with the Loyalty system. This API will handle communication with the external system via the provided HTTP endpoint.

Reference:MuleSoft API-led Connectivity

Utilize Existing Customer System API:Use the existing System API for customer data to retrieve necessary customer information. Combining these APIs ensures a modular approach and reuse of existing assets.

Reference:API-led Connectivity

Create Process API:Develop a Process API that combines data from both the Customer and Loyalty System APIs. This API will process the data, apply business logic to filter the top 10 percent of loyalty point holders, and format the results.

Reference:Designing Process APIs

Create Experience API:Develop an Experience API to serve the business consumers. This API will provide a user-friendly interface for initiating the integration and retrieving the results as a CSV file.

Reference:API Experience Layer

NEW QUESTION # 64

A Salesforce flow needs to connect to external APIs provided by Northern Trail Outfitters (NTO) and AnyAirlines to retrieve data. Which three steps should be taken to connect to the external APIs? (Choose three.)

- A. Create Named Credentials in Anypoint for NTO and AnyAirlines.
- B. Create Named Credentials in Salesforce for NTO and AnyAirlines.
- C. Create External Services in Salesforce for NTO and AnyAirlines.
- D. Use a Virtual service to call and consume the appropriate API in the Salesforce flow.
- E. Use an Action element to call and consume the appropriate API in the Salesforce flow.

Answer: B,C,E

Explanation:

To connect a Salesforce flow to external APIs, follow these steps:

Create Named Credentials in Salesforce:

Named Credentials in Salesforce simplify the authentication process by storing the URL and authentication details needed to call the external service. Set up Named Credentials for both NTO and AnyAirlines APIs.

Navigate to Salesforce Setup > Named Credentials > New Named Credential.

Enter the details for NTO API, including the endpoint URL and authentication settings.

Repeat the process for the AnyAirlines API.

Create External Services in Salesforce:

External Services allow you to register the external APIs with Salesforce so that they can be invoked from a flow. Navigate to Salesforce Setup > External Services > New External Service. Use the OpenAPI/Swagger or RAML specification files provided by NTO and AnyAirlines to register their APIs. This step involves importing the API specifications and configuring the services, which will be used in the flow. Use an Action Element in Salesforce Flow: Within Salesforce Flow, use the Action element to call the external services that were registered. This involves adding an Action to your flow and selecting the appropriate External Service action that corresponds to the API method you want to invoke. References: Salesforce External Services Documentation Salesforce Named Credentials Documentation

NEW QUESTION # 65

Northern Trail Outfitters is building a hyperautomation solution using Salesforce and MuleSoft. They need to use Salesforce Flow to automate a multi-departmental process in an external system and capture the outcome in Salesforce. How should the Salesforce Flow solution be structured to meet this requirement?

- A. An evaluation flow which evaluates when the process is completed and updates Salesforce records
- B. An autolaunched flow invoked by REST API to update Salesforce after the process is completed
- C. A Flow Orchestration to automate the multi-departmental process and update Salesforce records
- D. Parent and subflows invoked by REST API to capture user inputs and update Salesforce records

Answer: C

Explanation:

Salesforce Flow Orchestration is designed to manage complex, multi-step business processes that span multiple departments and systems. Here's how it can be structured to meet the requirement:

Automate Multi-Departmental Process:

Use Flow Orchestration to define and manage the steps involved in the multi-departmental process. It allows you to break down the process into stages and define the sequence of actions and approvals required.

Capture Outcome in Salesforce:

After completing the external process, Flow Orchestration can be configured to update Salesforce records with the outcome. This ensures that the results of the automated process are reflected within Salesforce.

Orchestration Capabilities:

Salesforce Flow Orchestration provides features such as task assignments, decision elements, and complex branching logic, which are ideal for managing multi-departmental workflows.
