Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q103-Q108):

NEW QUESTION # 103

How does a project implement the process to persist payment information daitain the Checkout flow for Salesforce B2B Commerce version 4.2 and beyond?

- A. Trigger a remote action to store the payment information in the URL query parameters.
- **B. Trigger the processPayment event and pass in the payment information object as an argument.**
- C. Trigger the externalProcessedPayment and pass in the payment information object as an argument.
- D. Trigger a remote action when the process payment button is selected to capture the payment.

Answer: B

Explanation:

To persist payment information data in the Checkout flow for Salesforce B2B Commerce version 4.2 and beyond, the project needs to trigger the processPayment event and pass in the payment information object as an argument. This event will invoke the processPayment method of the ccServicePayment class, which will validate and process the payment information and return a payment result object. The payment result object will contain the status and details of the payment transaction.

NEW QUESTION # 104

Which element can be used to pass HTML from a parent component to a child component? 03m 19s

- A. <template></template>
- B. <p></p>
- C. <html></html>
- **D. <slot></slot>**

Answer: D

Explanation:

To pass HTML from a parent component to a child component, the child component needs to have a <slot></slot> element in its template. A slot is a placeholder for markup that a parent component passes into a component's body. Slots are part of the Web Component specification. The parent component can use the slot name or the default slot to specify which HTML content goes into which slot of the child component. The other options are not valid elements for passing HTML from parent to child. Reference: Slots

Pass HTML Markup From Parent TO CHILD In Lightning Web Component
How parent component pass HTML to child component in Angular?

NEW QUESTION # 105

What is the fastest route to establishing the data needed for checkout development when setting up a new Store?

- **A. Use sfdx setup scripts**
- B. Select Add Sample Data when setting up the store
- C. Import a previously exported store archive
- D. Import the data with data loader

Answer: A

Explanation:

Option B is the correct answer because it describes the fastest route to establishing the data needed for checkout development when setting up a new store. The developer can use sfdx setup scripts to deploy a Lightning B2B testing environment that includes checkout flows, sample products, and a buyer. This way, the developer can quickly and easily test and customize the checkout flow using Experience Builder or Flow Builder. The other options are incorrect because they either require more time, manual steps, or additional tools to set up the data for checkout development. For example, importing a previously exported store archive or using data loader would require the developer to have access to the source data and the target org, and to map the fields and objects correctly. Selecting Add Sample Data when setting up the store would only provide a limited amount of data that may not be sufficient for checkout development. Create a B2B Commerce Org and Checkout Flow, B2B Commerce on Lightning Experience Developer Guide, B2B Commerce and D2C Commerce Developer Guide

NEW QUESTION # 106

The ccUtil apex class in Salesforce B2B Commerce provides numerous utility functions that can be leveraged in subscriber classes. What are two ways to check the input or return data of the Global API's? (2 answers)

- A. ccrz.ccUtil.isValid(Map<String, Object>) and ccrz.ccUtil.isValid(List<Object>)

- B. `ccrz.ccUtil.isValid(Map<String, Object>)` and `ccrz.ccUtil.isValid(List<Object>)`
- C. `ccrz.ccUtil.isNotEmpty(Map<String, Object>)` and `ccrz.ccUtil.isNotEmpty(List<Object>)`
- D. `ccrz.ccUtil.isEmpty(Map<String, Object>)` and `ccrz.ccUtil.isEmpty(List<Object>)`

Answer: C,D

Explanation:

The `ccUtil` apex class provides two methods to check the input or return data of the Global API's: `ccrz.ccUtil.isNotEmpty(Map<String, Object>)` and `ccrz.ccUtil.isEmpty(Map<String, Object>)`. These methods return true if the map is not null and contains at least one entry, or if the map is null or empty, respectively. Similarly, `ccrz.ccUtil.isNotEmpty(List<Object>)` and `ccrz.ccUtil.isEmpty(List<Object>)` return true if the list is not null and contains at least one element, or if the list is null or empty, respectively. These methods are useful for validating the input parameters or the output results of the Global API's.

NEW QUESTION # 107

Which three data types are supported for custom fields while using CSV file format for importing data for a store?

- A. Address
- B. Currency
- C. Text Area(Long)
- D. Picklist (Multi-Select)
- E. Lookup Relationship

Answer: B,C,E

Explanation:

Three data types that are supported for custom fields while using CSV file format for importing data for a store are Text Area(Long), Lookup Relationship, and Currency. A custom field is a field that is added by a developer or an administrator to an object to store additional information or data. A data type is a property that defines the type, format, and validation rules of a field. A CSV file is a file format that stores tabular data in plain text using commas to separate values. A store is a record that represents a B2B or B2C storefront in Salesforce. Text Area(Long) is a data type that allows users to enter up to 131,072 characters on separate lines. Text Area(Long) is supported for custom fields while using CSV file format for importing data for a store. Lookup Relationship is a data type that allows users to create a relationship between two objects and select a value from another record. Lookup Relationship is supported for custom fields while using CSV file format for importing data for a store. Currency is a data type that allows users to enter currency values and automatically convert them based on the user's locale and currency settings. Currency is supported for custom fields while using CSV file format for importing data for a store. Picklist (Multi-Select) is a data type that allows users to select one or more values from a predefined list of values. Picklist (Multi-Select) is not supported for custom fields while using CSV file format for importing data for a store. Address is a data type that allows users to enter address values and automatically format them based on the user's locale settings. Address is not supported for custom fields while using CSV file format for importing data for a store.
