HCVA0-003 Actual Real Questions: HashiCorp Certified: Vault Associate (003)Exam & HCVA0-003 Practice Questions

We don't just want to make profitable deals, but also to help our users pass the exams with the least amount of time to get HCVA0-003 certificate. Choosing our HCVA0-003 exam practice, you only need to spend 20-30 hours to prepare for the exam. Maybe you will ask whether such a short time can finish all the content, we want to tell you that you can rest assured, because our HCVA0-003 Learning Materials are closely related to the exam outline and the questions of our HCVA0-003 guide questions are related to the latest and basic knowledge. You will pass the HCVA0-003 exam only with our HCVA0-003 exam questions.

HashiCorp Certified: Vault Associate (003)Exam Sample Questions (Q78-Q83):

NEW QUESTION # 78

You can build a high availability Vault cluster with any storage backend.

- A. False
- B. True

Answer: A

Explanation:

Not all storage backends support high availability mode for Vault. Only the storage backends that support locking can enable Vault to run in a multi-server mode where one server is active and the others are standby.

Some examples of storage backends that support high availability mode are Consul, Integrated Storage, and ZooKeeper. Some examples of storage backends that do not support high availability mode are Filesystem, MySQL, and PostgreSQL. NEW QUESTION # 79

What is the correct order that Vault uses to protect data?

- A. unseal keys --> root key --> data
- **B. root key --> encryption key --> data**
- C. encryption key --> root key --> data
- D. root key --> data

Answer: B

Explanation:

Comprehensive and Detailed in Depth Explanation:

Vault protects data using a layered encryption process: root key --> encryption key --> data. The HashiCorp Vault documentation explains: "The data stored by Vault is encrypted. Vault needs the encryption key to decrypt it. The key is also stored with the data (in the keyring), but it is encrypted with another key known as the root key. Therefore, to decrypt the data, Vault must decrypt the encryption key, which requires the root key." This sequence ensures data security through multiple encryption layers.

The docs further clarify: "Unsealing is the process of accessing this root key. The root key is stored alongside all Vault data but is encrypted by yet another mechanism: the unseal key. To recap: most Vault data is encrypted using the encryption key in the keyring; the keyring is encrypted by the root key; and the root key is encrypted by the unseal key." Option B includes unseal keys but omits the encryption key's role. C and D misrepresent the order. Thus, A is correct.

NEW QUESTION # 80

Which of the following secrets engines can store static secrets in Vault for future retrieval?

- A. Transit
- B. PKI (certificates)
- **C. KV**
- D. Database

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation:

For static secrets:

* A. KV: "The KV secrets engine is the ONLY secrets engine that will store static data in Vault for future retrieval."

* Incorrect Options:

* B, C, D: Generate or encrypt, don't store static secrets.

Reference: <https://developer.hashicorp.com/vault/docs/secrets#secrets-engines>

NEW QUESTION # 81

An application has authenticated to Vault and has obtained dynamic database credentials with a lease of 4 hours. Four hours later, the credentials expire, and the application can no longer communicate with the backend database, so the application goes down.

What should the developers instruct the application to do to prevent this from happening again while maintaining the same level of security?

- **A. Renew the lease before expiration**
- B. Go back to using static credentials
- C. Revoke the lease before expiration
- D. Use a different auth method

Answer: A

Explanation:

Comprehensive and Detailed in Depth Explanation:

To prevent application downtime due to expired dynamic credentials while maintaining security, the application should renew the lease before it expires. The HashiCorp Vault documentation states: "The application should frequently 'check-in' with Vault and renew the lease to prevent the lease from expiring." It adds: "A lease must be renewed before it has expired. Once it has expired, it is permanently revoked and a new secret must be requested." The docs elaborate: "Dynamic secrets are designed to be short-lived and automatically rotated or revoked when their lease expires. Renewing the lease extends its validity, ensuring continuous access without compromising the security benefits of short-lived credentials." A (Static credentials) reduces security by eliminating rotation. C (Revoke) ends access early. D (Different auth method) doesn't address lease management. Thus, B is correct.

NEW QUESTION # 82

What can be used to limit the scope of a credential breach?

- A. Sharing credentials between applications
- B. Enable audit logging
- C. Storage of secrets in a distributed ledger
- **D. Use of a short-lived dynamic secrets**

Answer: D

Explanation:

Using a short-lived dynamic secrets can help limit the scope of a credential breach by reducing the exposure time of the secrets. Dynamic secrets are generated on-demand by Vault and automatically revoked when they are no longer needed. This way, the credentials are not stored in plain text or in a static database, and they can be rotated frequently to prevent unauthorized access. Dynamic secrets also provide encryption as a service, which means that they perform cryptographic operations on data in-transit without storing any data. This adds an extra layer of security and reduces the risk of data leakage or tampering.
