## Portworx-Enterprise-Professional Latest Learning Material - Valid Portworx-Enterprise-Professional Exam Online

If you are the first time to buy the Portworx-Enterprise-Professional learning material online, or you have bought them for many times, there may be some problem that puzzle you, if you have any questions about the Portworx-Enterprise-Professional exam dumps, you can ask our service staff for help. They have the professional knowledge of Portworx-Enterprise-Professional Training Materials, and they will be very helpful for solving your problem. In addition, we have free demo for you to try before buying the product, and you can have a try before purchasing.

### Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q67-Q72):

#### NEW QUESTION # 67

What solution should a Portworx administrator use to store snapshots of a critical application volume in an Object Store?

- A. Cloud Snapshot
- B. Local Snapshot
- C. Backups

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Cloud Snapshots are designed to store snapshots of critical application volumes directly into an external Object Store such as Amazon S3 or other S3-compatible storage. This solution provides offsite durability, disaster recovery capability, and long-term retention beyond the cluster's local storage capacity. Cloud Snapshots allow administrators to create consistent, incremental snapshots that are efficiently uploaded to cloud storage, enabling protection against data loss scenarios such as cluster failure or site outages. This contrasts with Local Snapshots, which remain on the cluster's local storage, and Backups, which may refer to full data copies. The Portworx documentation explains Cloud Snapshots as the recommended approach for storing critical volume snapshots securely and durably offsite, supporting business continuity strategies **【Pure Storage Portworx Cloud Snapshot Guide source】**.

#### NEW QUESTION # 68

An administrator wants to check the size, availability, and usage of all pools in the cluster. Which command should the administrator use?

- A. `kubectl get storagecluster`
- B. `pxctl service pool show`
- C. `pxctl cluster provision-status`

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To view detailed information about storage pools in a Portworx cluster-including size, availability, usage, and health-administrators should use the command `pxctl service pool show`. This CLI command provides a comprehensive overview of all storage pools configured on cluster nodes, including pool IDs, device names, pool sizes, free space, and status. It helps administrators monitor resource utilization, detect degraded pools, and plan capacity expansions. While `kubectl get storagecluster` shows the overall cluster CRD status and `pxctl cluster provision-status` shows provisioning status, neither provides detailed pool-level insights. Portworx's operational documentation recommends `pxctl service pool show` as the definitive command for monitoring pool resources and ensuring storage health across the cluster **【Pure Storage Portworx CLI Guide source】**.

#### NEW QUESTION # 69

What configuration steps should a Portworx Administrator perform to ensure that Portworx can use the S3 Object Store using a custom/3rd party (not signed by public CA) certificate?

- A. Create a secret containing the certificate and run `pxctl certificate import` command.
- B. No additional configuration is necessary.
- C. Create a Kubernetes secret containing the certificate and reference it in the storagecluster via env variable.

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

When integrating Portworx with an S3 Object Store secured by a custom or third-party certificate that is not signed by a public Certificate Authority (CA), administrators must manually provide the relevant CA certificate to Portworx. This involves creating a Kubernetes secret that contains the custom CA certificate and referencing this secret in the StorageCluster manifest through environment variables. This allows Portworx components to trust the certificate during TLS handshake with the S3 endpoint, avoiding connection failures due to untrusted certificates. Without this step, Portworx cannot securely communicate with the object store. The Portworx security and installation documentation highlights this practice as essential for secure Object Store integration in private or regulated environments where internal or custom PKIs are used **【Pure Storage Portworx Security Guide source】** .

#### NEW QUESTION # 70

Portworx uses secrets to authenticate Kubernetes to the Portworx system.

When using the shared authentication method, where is that secret stored?

- A. In the 'default' namespace
- **B. In the namespace that runs the application that needs to provision the storage resources**
- C. In the same namespace as the Portworx installation

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

When using shared authentication in Portworx, the Kubernetes secret that contains the authentication token or credentials is stored in the same namespace where the application requesting storage resides. This placement ensures that the application pods have access to the secret needed to authenticate to Portworx for volume provisioning and management. It enables a security boundary aligned with Kubernetes namespaces, restricting credentials to the scope of the application. Storing the secret in the default namespace or the Portworx installation namespace would be less secure or less flexible in multi-tenant clusters. Portworx authentication documentation highlights this design for efficient, secure access management in Kubernetes environments **【Pure Storage Portworx Security Guide source】** .

#### NEW QUESTION # 71

What is a key benefit of using on-demand snapshots in a Kubernetes environment with Portworx?

- A. They automatically scale storage capacity.
- **B. They provide immediate data recovery options without stopping applications.**
- C. They require no additional configuration after the initial setup.

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

On-demand snapshots in Portworx allow administrators and applications to create point-in-time copies of volumes instantly without requiring downtime or interrupting running workloads. This capability is critical in Kubernetes environments where high availability and continuous operation are mandatory. Snapshots capture the exact state of data at a moment, enabling rapid recovery from accidental deletion, corruption, or ransomware attacks. Since these snapshots are created live, applications continue to run seamlessly, ensuring minimal impact on user experience. Portworx's snapshot technology uses efficient -on-write mechanisms, which also minimize storage overhead. Official Portworx documentation emphasizes that on-demand snapshots enhance data protection strategies by enabling quick backups and restores without requiring maintenance windows or complex scheduling **【Pure Storage Portworx Snapshot Guide source】** .
