EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q26-Q31):

NEW QUESTION # 26
Question:

A company needs to rebuild a failed disk in its RAID 5 array. Which two factors would significantly impact the rebuild time?

- A. Write performance of the remaining disks
- B. Network bandwidth between the server and the storage array
- C. Capacity of the cache memory
- D. Capacity of the failed disk

Answer: A,D

Explanation:
Rebuilding a RAID 5 array after a disk failure depends on:
Capacity of the failed disk (C)- More data means longer rebuild time.
Write performance of the remaining disks (B)- Rebuild involves recalculating parity and writing data to the replacement disk, which stresses the surviving disks.
* Network bandwidth (A)is only relevant for accessing the array, not for internal rebuild operations.
* Cache capacity (D)helps performance in some scenarios, but the direct factors are disk size and performance.

NEW QUESTION # 27
Question:
A company wants to perform a full backup of its critical data. What is the main advantage of this approach?

- A. It provides the fastest data recovery.
- B. It minimizes the impact on production systems.
- C. It requires minimal storage space.
- D. It is the fastest backup method.

Answer: A

Explanation:
Afull backupcapturesall dataeach time it runs.
* Main advantage:Fastest recovery because no additional backup sets (like incrementals or differentials) need to be combined.
* Disadvantage:Takes more backup time and requires more storage space compared to incremental backups.
* Option B:Full backups have a higher impact because of the time and bandwidth required.
* Option C:Full backups consume the most storage.
* Option D:Full backups are not the fastest in terms of backup window - they are the fastest in recovery.

NEW QUESTION # 28
Question:
An Ethernet switch has eight ports, and all ports must be operational for 24 hours from Monday through Friday. However, failures of Port 6 occur within the week as follows:
* Tuesday: 6 AM to 8 AM
* Thursday: 5 PM to 10 PM
* Friday: 7 AM to 9 AMWhat is the MTBF (Mean Time Between Failures) of Port 6?

- A. 32 hours
- B. 37 hours
- C. 30 hours
- D. 40 hours

Answer: D

Explanation:
To calculate the MTBF, we need to determine the total operational time and the number of failures.
* Total operational time (Monday to Friday):5 days × 24 hours = 120 hours
* Number of failures:3 (Tuesday, Thursday, Friday)
MTBF = Total operational time / Number of failures
MTBF = 120 hours / 3 = 40 hours

NEW QUESTION # 29

Question:

When troubleshooting a virtual machine, which file is most likely to provide a detailed history of the VM's behavior?

- A. Virtual disk file
- B. Log file
- C. Memory state file
- D. Configuration file

Answer: B

Explanation:

Log files record events and messages related to the operations of a virtual machine. They provide detailed information about the VM's behavior, errors, and system messages, which are crucial for troubleshooting.
Reference:Dell Information Storage and Management Foundations 2023 Study Guide, Section: Virtualization and Storage.

NEW QUESTION # 30

Question:

A company is experiencing slow write performance on its RAID 6 array. What is the most likely cause of this performance bottleneck?

- A. Insufficient storage on the RAID controller
- B. Increased network latency between the server and the storage array
- C. Write penalty associated with dual parity calculations
- D. High read I/O load on the array

Answer: C

Explanation:

RAID 6 uses dual parity to provide fault tolerance, which requires additional calculations during write operations. This introduces a write penalty, as the system must compute and write two sets of parity data for each write operation, leading to slower write performance compared to other RAID levels.
* Insufficient storage on the RAID controller:Would affect storage capacity, not write performance.
* High read I/O load on the array:Impacts read performance, not write performance.
* Increased network latency:Affects data transfer times but not the internal write operations of the RAID array.
* Write penalty associated with dual parity calculations:The most likely cause of slow write performance in RAID 6.
