Cisco Designing Cisco Security Infrastructure Sample Questions (Q24-Q29):

NEW QUESTION # 24
A manufacturing company implemented IoT devices throughout their smart factory and needs a security solution that meets these requirements:
- Protect IoT devices from network-based attacks.
- Visibility into communication patterns.

- Anomaly detection for IoT traffic.
Which firewall technology or feature should be recommended?

- A. transparent firewall
- B. IPS/IDS
- C. traditional firewall
- D. zone-based firewall

Answer: B

Explanation:
An Intrusion Prevention/Detection System (IPS/IDS) provides visibility into IoT communication patterns, protects against network-based attacks, and uses anomaly detection to identify abnormal IoT traffic behaviors. This makes it the most effective solution for securing IoT devices in a smart factory.

NEW QUESTION # 25
When designing security for applications distributed across multiple cloud providers, what is a key consideration?

- A. MPLS cloud backbone routing
- B. Consistent identity and access policies
- C. High-performance DHCP services
- D. Local proxy deployment

Answer: B

Explanation:
Consistent identity and access management policies across cloud providers ensure uniform security controls and simplify governance in multi-cloud environments.

NEW QUESTION # 26
A developer is building new API functions for a cloud-based application. Before writing the code, the developer wants to ensure that destructive actions, including deleting and updating data, are properly protected by access control identifying sensitive fields such as those that contain passwords or personally identifiable information. Which approach must be used to score the risks proactively?

- A. Open API Specification Analysis
- B. SBOM Generation
- C. CSPM
- D. SAST

Answer: A

Explanation:
Open API Specification Analysis evaluates API definitions before code is written, identifying risky endpoints (such as delete or update functions) and sensitive fields (like PII or passwords). This allows developers to proactively score risks and apply proper access controls early in the design phase.

NEW QUESTION # 27
A developer company recently implemented a testing environment based on Linux operating system. The company needs a technology solution that produces tracing and filtering capabilities in the Linux kernel. Which technology meets these requirements without modifying the kernel source code?

- A. eBPF
- B. NGFW
- C. VPP
- D. distributed firewall

Answer: A

Explanation:
eBPF (extended Berkeley Packet Filter) allows tracing, filtering, and monitoring directly inside the Linux kernel without modifying the kernel source code. It provides deep visibility into system and application behavior, making it ideal for secure and efficient observability in a testing environment.

NEW QUESTION # 28

A company has been facing recurring issues with SQL injection vulnerabilities affecting the products, leading to significant disruptions for customers. To address the security concerns proactively, the company wants to integrate a tool into the CI/CD pipeline. The tool must be capable of identifying vulnerabilities such as SQL injection early in the development process, which allows developers to rectify issues before the code is deployed. Which solution must be implemented to meet the requirement?

- A. workflow automation tools, such as GitHub Actions, Azure
- B. Dynamic Application Security Testing tools, such as OWASP ZAP, Veracode, Burp Suite
- C. build log observability tools, such as Splunk, Datadog
- D. Static Application Security Testing tools, such as Checkmarx, Fortify, SonarQube

Answer: D

Explanation:
Static Application Security Testing (SAST) tools analyze source code during the development and build phases of the CI/CD pipeline. They can identify coding flaws such as SQL injection vulnerabilities early, allowing developers to fix issues before deployment.
