Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q41-Q46):

NEW QUESTION # 41

A system administrator needs to determine when permissions were last changed for an Anypoint Platform user.

- **A. Audit Logging**
- B. Anypoint Studio
- C. Mule Stack Traces
- D. Anypoint Monitoring

Answer: A

Explanation:

Audit Logging: This feature in Anypoint Platform provides a searchable history of actions performed within the platform. It is designed specifically for governance and security compliance.

What it tracks: It records "who did what and when." This includes changes to:

User permissions and roles (Access Management).

Environment configurations.

API Manager policies.

Why others are incorrect:

Anypoint Monitoring: Focuses on application performance (CPU, Memory, API analytics), not administrative actions.

Stack Traces: Are used for debugging runtime application errors, not auditing user permissions.

NEW QUESTION # 42

According to MuleSoft, what is a major distinguishing characteristic of an application network in relation to the integration of systems, data, and devices?

- A. It uses a well-organized monolithic approach with standards
- **B. It is built for change and self-service**
- C. It leverages well-accepted internet standards like HTTP and JSON
- D. It uses CI/CD automation for real-time project delivery

Answer: B

Explanation:

The Application Network: MuleSoft defines an application network as a network of applications, data, and devices connected with APIs to make them pluggable and reusable.

Built for Change: Unlike rigid point-to-point integrations, an application network is designed to be flexible. Because the nodes (APIs) are reusable and discoverable, the network can evolve and change as business needs change without breaking existing connections.

Self-Service: By publishing these APIs to Exchange, developers across the organization can discover and reuse them (Self-Service), facilitating the "bottom-up" emergence of the network.

NEW QUESTION # 43

A MuleSoft developer must implement an API as a Mule application, run the application locally, and execute unit tests against the running application.

- **A. Anypoint Studio**
- B. API Manager
- C. API Designer
- D. Anypoint CLI

Answer: A

Explanation:

Anypoint Studio: This is the desktop Integrated Development Environment (IDE) for MuleSoft.

Capabilities:

Implement: It provides the graphical interface to drag-and-drop connectors and configure flows.

Run Locally: It includes an embedded Mule Runtime engine, allowing developers to run and debug apps on their own machines.

Execute Unit Tests: It has MUnit fully integrated, allowing developers to run tests and see coverage reports directly in the IDE.

Why others are incorrect:

API Designer: Web-based tool for designing specs (RAML), not implementing logic or running local runtimes.

Anypoint CLI: Command-line tool for platform operations, not development/testing.

NEW QUESTION # 44

Which key DevOps practice and associated Anypoint Platform component should a MuleSoft Integration team adopt to improve delivery quality?

- A. Passive monitoring with Anypoint Monitoring
- B. Continuous design with API Designer
- C. Manual testing with Anypoint Studio
- **D. Automated testing with MUnit**

Answer: D

Explanation:

DevOps & Quality: A core tenet of DevOps is CI/CD (Continuous Integration/Continuous Delivery). To achieve high quality in a fast-paced CI/CD pipeline, testing must be automated, not manual.

MUnit: This is the native testing framework for Mule applications. It allows developers to write unit and integration tests that run automatically during the build process (e.g., via Maven).¹² Why others are incorrect:³⁴ Manual testing (B): Is slow, error-prone, and not a "DevOps" scaling practice.⁵⁶ Passive monitoring (A): happens after deployment (Operations), whereas MUnit ensures quality⁷ during development/build.

NEW QUESTION # 45

According to MuleSoft, which system integration term describes the method, format, and protocol used for communication between two systems? 4

- A. Component
- B. Interaction
- C. Interface
- D. Message

Answer: C

Explanation:

Comprehensive and Detailed Explanation:

The Interface: In system integration and MuleSoft terminology, the Interface is the contract that defines how two systems communicate. It specifies:

Protocol: How data is transmitted (e.g., HTTP, FTP, AMQP).

Format: The structure of the data (e.g., JSON, XML, CSV).

Method: The specific action (e.g., GET, POST).

Why other options are incorrect:

Message: This refers to the actual data payload (the content) being sent, not the rules of communication.

Component: This usually refers to a specific building block within the Mule flow (like a Logger or a Database connector) or a software module, not the communication definition itself.

Interaction: This describes the act of communicating, not the definition of the standard used.
