Solutions provide updated, valid, and actual Microsoft 365 Copilot & Agent Administration Fundamentals (AB-900) Dumps that will assist you in AB-900 preparation and you can easily get success in this challenging Microsoft AB-900 exam with flying colors.

Microsoft 365 Copilot & Agent Administration Fundamentals Sample Questions (Q40-Q45):

NEW QUESTION # 40

You want to view the administrative actions taken by a service administrator in Microsoft 365.

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

The correct selections are No, Yes, Yes . Microsoft documents that the Audit page in the Microsoft Defender portal can be used to search the unified audit log for user and admin actions in the organization.

Microsoft also states that audit log search in the Defender portal is the same as audit log search in the Microsoft Purview portal , which means both portals can be used to review administrative actions taken in Microsoft 365.

Microsoft further explains that Microsoft Purview Audit enables organizations to search for audit records of activities that users and admins perform across Microsoft services, making it a correct tool for this requirement.

By contrast, Search & intelligence in the Microsoft 365 admin center is not the feature used to investigate administrator actions through the unified audit log. It is not Microsoft's documented audit search tool for this purpose. Therefore, for this hotspot the right answers are No for Search & intelligence, Yes for Audit in Microsoft Defender, and Yes for Audit in Microsoft Purview.

NEW QUESTION # 41

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE Each correct selection is worth one point

Answer:

Explanation:

Explanation:

The correct selections are Yes, Yes, Yes . For statement 1, Microsoft Support explains that if you are not a site owner, you might still be able to invite other people to the site , although the invitation can generate an access request that a site owner approves or declines. Microsoft also states that site users have the opportunity to invite other people to collaborate on sites , unless that feature is disabled. That makes the statement true.

For statement 2, Microsoft Learn states that in SharePoint you can give people permissions to a site by adding individual users, security groups, or Microsoft 365 groups to one of the three SharePoint groups, including the Members group. That directly supports the statement.

For statement 3, Microsoft documents that site ownership and membership can be managed by adding or removing owners, members, site owners, site members, and site visitors . For group-connected sites, Microsoft also documents that owners can manage group ownership and remove owner status. Therefore, a site owner can remove another site owner, provided at least one owner remains.

NEW QUESTION # 42

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point

Answer:

Explanation:

The correct selections are No, Yes, No . Statement 1 is No because Microsoft 365 Copilot is a work service that requires users to sign in with a work or school account . Microsoft documentation for setup and use consistently describes licensing and access in the context of signed-in organizational users, not anonymous access. Statement 2 is Yes because Microsoft documents that administrators can manage self-service purchases and trials in the Microsoft 365 admin center , including allowing or blocking eligible products for self-service acquisition. That means admins can allow self-service purchasing where the product is eligible. Statement 3 is No because Microsoft explicitly states that assigning Microsoft 365 Copilot licenses to cross-tenant users, including guests , isn't supported.

NEW QUESTION # 43

Your organization has a Microsoft 365 subscription.

You need to use Microsoft Purview to meet the following requirements:

Prevent users from sharing files that contain Personally Identifiable Information (PII).

Use machine learning to train a model that detects sensitive content.

Which Microsoft Purview solution should you use for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

* Prevent users from sharing PII: Data Loss Prevention

* Use machine learning to train a model: Information Protection

The correct selections are Data Loss Prevention and Information Protection . Microsoft states that Microsoft Purview Data Loss Prevention (DLP) helps organizations identify, monitor, and automatically protect sensitive information, including preventing people from sharing sensitive items such as PII in Microsoft 365 locations and other supported channels. That directly matches the requirement to stop users from sharing files that contain personally identifiable information.

For the second requirement, the correct choice is Information Protection because Microsoft Purview's classification and labeling capabilities include trainable classifiers , which Microsoft describes as a tool you can train using machine learning to recognize types of sensitive or business content. Microsoft positions these classification capabilities under Microsoft Purview Information Protection and data classification. That makes Information Protection the best fit for "use machine learning to train a model that detects sensitive content." The other options are not the best match here. Communication Compliance monitors risky communications, DSPM for AI focuses on AI posture and exposure, and Insider Risk Management detects risky user behavior rather than blocking PII sharing or training classifiers.

NEW QUESTION # 44

Select the answer that correctly completes the sentence.

Microsoft Entra Privileged Identity Management (PIM) provides time-bound role activation .

Answer:

Explanation:

Explanation:

time-bound role activation

The correct answer is time-bound role activation . Microsoft Learn explains that Microsoft Entra Privileged Identity Management (PIM) allows users to be made eligible for privileged roles and then activate those roles only when needed. Microsoft also states that once activated, the role is active for a preconfigured period of time , after which the privileged access expires automatically. This is the core just- in-time and time-limited access model that PIM is designed to provide. (learn.microsoft.com) The other options do not match Microsoft's definition of PIM. It is not primarily described as providing restricted access to Microsoft 365 services , the lifecycle management of users , or the management of enterprise applications . Those areas relate more closely to other Microsoft Entra and Microsoft 365 governance capabilities. Microsoft specifically positions PIM as a service to manage, control, and monitor access to important resources by using eligible assignments , approval workflows , MFA if required , and temporary role activation . Therefore, the phrase that correctly completes the sentence is time-bound role activation . (learn.microsoft.com)
