An engineer deployed a Cisco WLC using local EAP. Users who are configured for EAP-PEAP cannot connect to the network. Based on the local EAP debug controller provided, why is the client unable to connect?

- **A. The client is failing to accept certificate.**
- B. The Cisco WLC local EAP profile is misconfigured
- C. The Cisco WLC is configured for the incorrect date.
- D. The user is using invalid credentials.

Answer: A

NEW QUESTION # 57

An engineer must implement a CPU ACL that blocks web management traffic to the controller, but they also must allow guests to reach a Web Authentication Redirect page. To which IP address is guest client HTTPS traffic allowed for this to work?

- **A. virtual interface IP**
- B. client interface IP
- C. controller management IP
- D. DNS server IP

Answer: A

Explanation:

For guests to reach a Web Authentication Redirect page while blocking web management traffic to the controller, guest client HTTPS traffic must be allowed to a specific IP address that does not interfere with management access. The virtual interface IP on a Cisco Wireless LAN Controller serves as a DHCP relay and is used for web authentication processes. Therefore, allowing HTTPS traffic to this IP enables guests to reach the redirect page without granting them access to manage the controller. NEW QUESTION # 58

The marketing department creates a promotion video for the branch store. Only interested hosts must receive the video over wireless multicast. What allows this feature?

- A. TPC
- **B. WMF**
- C. WMM
- D. DCA

Answer: B

Explanation:

Wireless Multicast Forwarding (WMF) is the feature that allows the delivery of multicast content, such as a promotional video, to only interested hosts over a wireless network. It optimizes the use of network resources by ensuring that only the hosts that have expressed interest in the multicast group receive the data.
