CertiProf Ethical Hacking Professional Certification Exam Sample Questions (Q27-Q32):

NEW QUESTION # 27

Do all hackers always carry out criminal activities?

- A. No, ethical hackers responsibly report discovered vulnerabilities to the appropriate organization for remediation.
- B. Yes, all hackers commit crimes such as hacking banks or social media accounts.
- C. Yes, hackers always sell stolen information to the highest bidder.

Answer: A

Explanation:

Not all hackers engage in criminal activity, making option B the correct answer. The term "hacker" broadly refers to individuals with technical skills to understand and manipulate systems. Their intent determines whether their actions are ethical or malicious.

Ethical hackers, also known as White Hat hackers, work legally and with authorization to identify vulnerabilities in systems, networks, and applications. When they discover security weaknesses, they follow responsible disclosure practices by reporting findings to the affected organization so issues can be fixed promptly.

Option A is incorrect because it incorrectly generalizes all hackers as criminals. Option C is incorrect because selling stolen information describes malicious actors, often referred to as Black Hat hackers.

Understanding this distinction is important when analyzing current security trends, as ethical hacking has become a legitimate profession. Many organizations now rely on penetration testers, bug bounty programs, and internal security teams to proactively defend against cyber threats.

Ethical hacking contributes to safer digital environments by helping organizations strengthen defenses before attackers exploit vulnerabilities. Recognizing that hacking skills can be used constructively supports responsible security practices and professional cybersecurity development.

NEW QUESTION # 28

What tool would you use to scan ports?

- A. Shodan
- B. Metasploit
- C. Nmap

Answer: C

Explanation:

Nmap is the primary tool used for port scanning, making option B the correct answer. Port scanning is a core activity during the reconnaissance and scanning phases of penetration testing, where the goal is to identify open, closed, or filtered ports on target systems.

Nmap allows ethical hackers to discover which services are running, their versions, and potential misconfigurations. It supports multiple scan types, including TCP SYN scans, UDP scans, and service detection scans, making it highly versatile and efficient.

Option A is incorrect because Metasploit is primarily an exploitation framework, not a dedicated port scanner.

Option C is incorrect because Shodan is an internet-wide search engine, not a direct scanning tool used against specific targets.

Understanding port scanning is essential for identifying attack surfaces. Open ports often expose services that may contain vulnerabilities or misconfigurations. Ethical hackers use Nmap responsibly to map networks and guide further testing.

From a defensive perspective, regular port scanning helps organizations identify unnecessary services and enforce least-exposure principles. Nmap remains one of the most fundamental tools in ethical hacking and network security.

NEW QUESTION # 29

Is it possible to clone a web page?

- A. No
- B. Yes

Answer: B

Explanation:

Yes, it is possible to clone a web page, making option B the correct answer. Web page cloning involves copying the structure, appearance, and content of a legitimate website, often for malicious purposes such as phishing or credential harvesting.

Attackers use cloning to trick users into believing they are interacting with a trusted site. Ethical hackers study this technique to demonstrate the risks of social engineering and help organizations implement defenses such as user education, domain monitoring,

and email security controls.

Cloning does not typically require exploiting vulnerabilities; instead, it abuses publicly available content and human trust. This makes it a powerful and common attack vector.

Understanding web page cloning helps organizations recognize phishing threats and protect users from impersonation attacks. Ethical hackers use controlled demonstrations to raise awareness and improve detection capabilities.

NEW QUESTION # 30

What is a hacktivist?

- A. They use their computer skills to steal sensitive information, to infect computer systems, to restrict access to a system.
- B. Refers to politicians who get involved in social issues by being in the news.
- C. Refers to hacking into a computer system for political or social purposes. A hacktivist breaks into a computer system, but always with the aim of influencing ideological, religious, political or social causes.

Answer: C

Explanation:

Hacktivism is a modern security trend that sits at the intersection of computer hacking and social activism. A

"hacktivist" is an individual or a member of a group who uses their technical expertise to gain unauthorized access to systems or disrupt digital services to promote a specific political, social, or ideological agenda.

Unlike traditional cybercriminals who are typically motivated by financial gain, or state-sponsored actors seeking geopolitical intelligence, hacktivists act as "digital protesters." Their goal is often to draw public attention to perceived injustices, government policies, or corporate misconduct.

Common tactics used by hacktivists include Distributed Denial of Service (DDoS) attacks to take down a target's website, "defacing" web pages with political messages, or leaking confidential internal documents (often referred to as "doxing") to embarrass or expose the target. High-profile groups like Anonymous or WikiLeaks are frequently cited as examples of this phenomenon. While the hacktivist might believe their actions are morally justified by their cause—be it environmental protection, free speech, or human rights—their actions remain illegal under most international and domestic computer crime laws because they involve unauthorized access or disruption of service.

From a defensive standpoint, hacktivism represents a unique threat profile. Organizations must monitor the social and political climate to gauge if they might become a target of a hacktivist campaign. For instance, a company involved in a controversial project might see a sudden surge in scan attempts or phishing attacks.

Understanding hacktivism is essential for modern threat intelligence, as it requires security teams to look beyond technical vulnerabilities and consider the reputational and ideological factors that might drive an attack. This trend highlights how the digital realm has become a primary battlefield for social discourse and political conflict in the 21st century.

NEW QUESTION # 31

Which of the following is a network security protocol designed to authenticate and authorize remote users to securely access network resources?

- A. SSH (Secure Shell)
- B. FTP (File Transfer Protocol)
- C. SSL (Secure Sockets Layer)

Answer: A

Explanation:

SSH (Secure Shell) is a network security protocol specifically designed to provide secure remote access to systems, making option A the correct answer. SSH authenticates users and encrypts all communications between the client and server, protecting credentials and session data from interception.

SSH is widely used by system administrators and ethical hackers for secure remote login, command execution, and file transfers. It replaces insecure protocols such as Telnet, which transmit data in plain text.

SSH supports multiple authentication mechanisms, including passwords, public-key authentication, and multi-factor authentication.

Option B, FTP, is incorrect because it transmits credentials and data in plain text and does not provide secure authentication by default. Option C, SSL, is incorrect in this context because SSL is a cryptographic protocol used to secure data in transit but is not specifically designed for remote system access and authorization.

From an ethical hacking perspective, understanding SSH is essential for both attacking and defending systems. Misconfigured SSH services can lead to brute-force attacks or unauthorized access, while properly secured SSH greatly enhances system security.

SSH plays a critical role in secure network administration and is a foundational component of modern information security controls.

NEW QUESTION # 32

.....

The talent is everywhere in modern society. This is doubly true for IT field. With the popularity of the computer, hardly anyone can't use a computer. Working in the IT industry, don't you feel pressure? Educational level is not representative of your strength. Education is just a ticket, however really keeping your status is your strength. As IT staff, how to cultivate your strength? It is a good choice to take IT certification test which can not only help you master more skills, also can get the certificate to prove your ability.
