According to MuleSoft which deployment characteristic applies to a microservices application architecture?

- A. Services exist as independent deployment artifacts and can be scaled independently of other services
- B. All services of an application can be deployed together as single Java WAR file
- C. Core business capabilities are encapsulated in a single deployable application
- D. A deployment to enhance one capability requires a redeployment of all capabilities

Antwort: A

Begründung:

Microservices architecture is designed to enhance flexibility, scalability, and maintainability by decomposing applications into small, independent services. Here's a detailed explanation:

Independent Deployment:

Definition: Each microservice is developed, deployed, and managed independently. This allows teams to work on different services without interfering with each other.

Scalability: Services can be scaled independently based on demand, improving resource utilization and system resilience.

Benefits:

Flexibility: Enhances the ability to update or scale specific parts of an application without affecting the whole system.

Resilience: Isolates failures to individual services, preventing cascading failures across the entire application.

Technology Diversity: Allows the use of different technologies and languages best suited for each service.

In which order are the API Client API Implementation and API Interface components called in a typical REST request?

- A. API Client > API Implementation > API Interface
- B. API Interface > API Client > API Implementation
- C. API Implementation > API Interface > API Client
- **D. API Client > API Interface > API Implementation**

Antwort: D

Begründung:

In a typical REST request, the components are called in a specific order to handle the client's request and provide the response.

Here's the order and detailed explanation:

API Client:

Initiates Request: The client (e.g., web or mobile application) sends a request to the API endpoint.

API Interface:
