Newest Web-Development-Applications Latest Learning Materials - Unparalleled Web-Development-Applications Exam Tool Guarantee Purchasing Safety

To keep the Web-Development-Applications practice questions in WGU PDF format up to date, we regularly update them to according to changes in the real Web-Development-Applications exam content. This dedication to keep WGU Web Development Applications (Web-Development-Applications) exam questions relevant to the Web-Development-Applications actual test domain ensures that customers always get the most up-to-date WGU Web-Development-Applications questions from Pass4sures.

WGU Web-Development-Applications Exam Syllabus Topics:

Topic	Details

Topic 1	<ul style="list-style-type: none"> • Validation, Testing, and Form Development: This section of the exam measures skills of Web Developers and covers the ability to validate code, test web pages for accuracy, and build form components. It includes understanding how to detect errors, ensure compliance with standards, and implement form fields with inline validation to improve user experience. The focus is on creating forms that work reliably, meet usability expectations, and maintain proper data entry flow.
Topic 2	<ul style="list-style-type: none"> • Responsive Web Design (RWD) for Browsers and Apps: This section of the exam measures skills of Front-End Designers and covers concepts related to mobile-first layout planning, responsive frameworks, and techniques used to ensure compatibility with modern browsers and applications. Candidates must demonstrate how to adjust elements for better usability on mobile devices and apply responsive strategies that allow a single design to function seamlessly across various environments.
Topic 3	<ul style="list-style-type: none"> • Creating Adaptive Web Documents and Pages: This section of the exam measures skills of Front-End Designers and covers the techniques needed to make websites display correctly across traditional desktops and mobile devices. It emphasizes adaptive page layout, flexible formatting, and user-friendly presentation so that content remains readable and functional on screens of different sizes. Candidates are expected to show an understanding of how to create consistent designs that respond smoothly to device changes.
Topic 4	<ul style="list-style-type: none"> • HTML5, CSS3, and JavaScript Foundations: This section of the exam measures skills of Web Developers and covers the essential ability to manually code using HTML5, CSS3, and JavaScript to create structured, visually styled, and interactive web content. It focuses on building accurate page layouts, applying modern styling rules, and writing basic scripts that support user interaction. The aim is to ensure candidates can construct professional web documents using current standards and properly integrate all three technologies.

WGU Web Development Applications Sample Questions (Q94-Q99):

NEW QUESTION # 94

Which technique should a developer use for text-based hyperlink on mobile web page?

- **A. Padding the clickable area around the link**
- B. Keeping links uniform
- C. Deploying graphical links
- D. Using dynamic page elements near the link

Answer: A

Explanation:

When designing text-based hyperlinks for mobile web pages, it is essential to ensure that the links are easily tappable. Adding padding around the clickable area increases the touch target size, making it easier for users to interact with the link on a mobile device.

* Techniques for Mobile-Friendly Links:

* **Padding the Clickable Area:** By adding padding, you increase the touchable area around the link, which helps prevent user frustration due to missed taps.

* CSS Example:

```
a {
padding: 10px;
display: inline-block;
}
```

* Other Options:

* **B. Keeping links uniform:** This refers to making all links look the same, which is good for consistency but doesn't specifically address the issue of touch targets.

* **C. Deploying graphical links:** While graphical links can be effective, they do not necessarily improve touch target size for text-based hyperlinks.

* **D. Using dynamic page elements near the link:** This can lead to a cluttered interface and does not address the touch target issue directly.

* References:

- * MDN Web Docs - Touch targets
- * Google Developers - Mobile Web Development

NEW QUESTION # 95

Which of the following statements is true about CSS properties that define sizes or positions with two values?

- A. It accepts pixel values only.
- B. It accepts Hex values only
- C. It requires a minimum of one value to apply
- **D. It requires a minimum of two values to apply.**

Answer: D

Explanation:

This question seems to be about a property or method that requires two values. Without additional context, the most common scenario that fits this description is CSS properties that define sizes or positions with two values. Examples include background-position, margin, padding, etc., where both horizontal and vertical values are needed.

NEW QUESTION # 96

Given the following code:

```
````javascript
var data;
````
```

What is the value of `data` when the code runs?

- **A. Undefined**
- B. Null
- C. An empty string
- D. A single character

Answer: A

Explanation:

> "In JavaScript, any variable declared but not assigned a value is automatically set to `undefined`." Example:

```
````javascript
var data;
console.log(data); // undefined
````
```

References:

* MDN Web Docs: undefined

* JavaScript Guide: Variables

NEW QUESTION # 97

Given the following CSS code:

□ How many seconds elapse before the font-size property begins to increase when a user hovers a mouse pointer over the delay element?

- **A. 0**
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

The CSS transition-delay property specifies how long to wait before starting a property transition. In the given CSS code, the transition-delay is set to 2s.

* CSS Transition Properties:

* transition-property: Specifies the CSS property to which the transition is applied (font-size in this case).

* transition-duration: Specifies how long the transition takes (4s).

* transition-delay: Specifies the delay before the transition starts (2s).

Example:

* Given HTML:

```
<div id="delay">Hover over me</div>
```

* Given CSS:

```
#delay {  
font-size: 14px;  
transition-property: font-size;  
transition-duration: 4s;  
transition-delay: 2s;  
}  
#delay:hover {  
font-size: 36px;  
}
```

Explanation: When a user hovers over the element with id="delay", it will wait for 2 seconds before the transition effect on font-size starts.

* MDN Web Docs - transition-delay

* W3C CSS Transitions

NEW QUESTION # 98

Given the following code:

Which type of user input does the developer request by specifying the pattern attribute?

- A. price
- B. Date
- C. Country code
- D. Latitude/longitude

Answer: D

Explanation:

The pattern attribute in the <input> element is used to specify a regular expression that the input's value must match for it to be considered valid. The given pattern `^-?\d{1,3}\.\d+` matches strings that represent decimal numbers with an optional negative sign, typically used for latitude and longitude values.

* Pattern Explanation:

* `-?` allows for an optional negative sign.

* `\d{1,3}` matches one to three digits.

* `\.` matches a literal dot.

* `\d+` matches one or more digits.

* Usage Example:

```
<input type="text" pattern="^-?\d{1,3}\.\d+" placeholder="Enter latitude or longitude">
```

This pattern ensures the input matches the format of latitude/longitude values.
