NEW QUESTION # 178

A daily backup job for seven Hyper-V VMs has been configured at the main site, keeping 14 days' worth of backup files. They want to get a copy of the VM backups to a repository at the disaster recovery site. They want to keep six months' worth of backup files at the disaster recovery site. They also need to be able to restore the VMs to any given day within two months and any given

week within the six months. How should a backup copy job be configured to meet these requirements?

- A. Use immediate copy (mirroring) mode, keeping 180 days of retention.
- B. Use immediate copy (mirroring) mode, keeping 62 days of retention and 26 weekly GFS restore points.
- **C. Use periodic copy (pruning) mode, keeping 62 days of retention and six monthly GFS restore points.**
- D. Use periodic copy (pruning) mode, keeping 180 days of retention.

Answer: C

Explanation:

To meet the specified requirements, configuring a backup copy job in periodic copy (pruning) mode with 62 days of retention and six monthly Grandfather-Father-Son (GFS) restore points is the best approach. This setup allows for daily backups for up to two months and weekly backups for up to six months, aligning with the desired restore capabilities. References: Veeam Backup & Replication User Guide, Veeam GFS Retention Policy Explanation

NEW QUESTION # 179

What feature is only available with the Veeam Agent for Linux?

- A. File-level backup
- B. Volume backup
- C. Backup from native snapshots
- **D. Application-aware processing of**

Answer: D

Explanation:

<https://www.veeam.com/linux-backup-free.html>

Built-in snapshot and CBT drivers: Get true incremental Linux backups enabled by Veeam's kernel module with built-in volume snapshot capabilities and proprietary CBT capabilities.

NEW QUESTION # 180

A power outage on Site A is expected during the night. The disaster recovery strategy has been implemented (see diagram). What is the correct way to start replicated VMs on Site B to minimize data loss?

- **A. Execute "Planned failover".**
- B. Power on VMs manually through vCenter.
- C. Execute "Permanent failover" from vCenter.
- D. Execute "Failover plan".

Answer: A

Explanation:

A planned failover is a process that allows for the seamless switching from the original VMs at Site A to their replicas at Site B with no data loss. This is the correct course of action when a power outage is expected, as it is a controlled process that ensures that all data is synchronized before the switch is made. This action minimizes data loss and ensures that the VMs on Site B are up-to-date. References:

* Veeam Backup & Replication User Guide: Failover and Failback

* Veeam Help Center: Planned Failover Procedure

NEW QUESTION # 181

At 18:00, after a power outage, a VM is stuck in an infinite boot loop. The VM is configured as follows.

The last backup was created at 01:00. Choose the recovery approach that results in the least amount of data loss and lowest chance of data corruption.

- **A. Instant VM Recovery**
- B. Instant VM Recovery with quick rollback
- C. VM disk recovery
- D. VM disk recovery with quick rollback

Answer: A

NEW QUESTION # 182

• • • • •

As is known to us, the VMCE_v12 Certification has been increasingly important for a lot of modern people in the rapid development world. Why is the VMCE_v12 certification so significant for many people? Because having the certification can help people make their dreams come true, including have a better job, gain more wealth, have a higher social position and so on. We believe that you will be fond of our products.
