- A. Tag the objects with the metadata to search on that.
- B. Use the query functionality of S3.
- **C. Make your own DB system which stores the S3 metadata for the search functionality.**
- D. Use the indexing feature of S3.

* Reader endpoint - Includes all Aurora Replicas in the DB cluster under a single DNS CNAME. You can use the reader endpoint to implement DNS round robin load balancing for read-only connections.

* Instance endpoint - Each instance in the DB cluster has its own individual endpoint. You can use this endpoint to connect directly to a specific instance.

* Custom endpoints - User-defined DNS endpoints containing a selected group of instances from a given cluster - <https://aws.amazon.com/about-aws/whats-new/2018/11/amazon-aurora-simplifies-workload-management-with-c>
