We can promise that the CCDAK certification preparation materials of our company have the absolute authority in the study materials market. We believe that the study materials designed by our company will be the most suitable choice for you. You can totally depend on the CCDAK Guide files of our company when you are preparing for the exam.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q203-Q208):

NEW QUESTION # 203

Which partition assignment minimizes partition movements between two assignments?

- A. RangeAssignor
- B. PartitionAssignor
- C. StickyAssignor
- D. RoundRobinAssignor

Answer: C

Explanation:

The StickyAssignor tries to minimize partition movement by preserving existing assignments as much as possible while still achieving a balanced assignment. This improves consumer stability and reduces rebalances.

From the Kafka Consumer Assignor Documentation:

"The StickyAssignor attempts to preserve as many existing assignments as possible, which helps minimize partition movement between rebalances."

* RoundRobinAssignor focuses on even distribution, not stability.

* RangeAssignor groups partitions by topic and assigns them consecutively, but can lead to imbalances.

* PartitionAssignor is an abstract base class, not an assignor used directly.

Reference: Kafka Consumer Assignor Docs

NEW QUESTION # 204

You need to consume messages from Kafka using the command-line interface (CLI).

Which command should you use?

- A. kafka-consume
- **B. kafka-console-consumer**
- C. kafka-consumer
- D. kafka-get-messages

Answer: B

Explanation:

The official CLI utility for consuming messages from Kafka topics is kafka-console-consumer.sh. It connects to the broker, consumes messages, and prints them to standard output.

From Kafka CLI Tools Documentation:

"kafka-console-consumer.sh is used to read data from a Kafka topic and write it to standard output." The other options are not valid Kafka CLI tools.

Reference: Apache Kafka Documentation > kafka-console-consumer.sh

NEW QUESTION # 205

In stream processing applications, handling out-of-order data can be a challenge which could affect the implemented business logic.

Which type of Join handles out-of-order records?

- A. KTable-KStream
- B. KStream-GlobalKTable
- **C. KStream-KStream**
- D. KTable-KTable

Answer: C

NEW QUESTION # 206

You want to send a message of size 3 MB to a topic with default message size configuration. How does KafkaProducer handle large messages?

- A. KafkaProducer divides messages into sizes of max.request.size and sends them in order
- B. MessageSizeTooLarge exception will be thrown, KafkaProducer retries until the number of retries are exhausted
- **C. MessageSizeTooLarge exception will be thrown, KafkaProducer will not retry and return exception immediately**
- D. KafkaProducer divides messages into sizes of message.max.bytes and sends them in order

Answer: C

Explanation:

MessageSizeTooLarge is not a retryable exception.

NEW QUESTION # 207

You create a topic named stream-logs with:

- * A replication factor of 3
 - * Four partitions
 - * Messages that are plain logs without a key
- How will messages be distributed across partitions?

- A. The first message will always be written to partition 0.
- B. All messages will be written to the same log segment.
- C. Messages will be distributed among all the topic partitions with strict ordering.
- **D. Messages will be distributed round-robin among all the topic partitions.**

Answer: D

Explanation:

If a message key is not provided, Kafka's default partitioner uses round-robin distribution across available partitions.

From Kafka Producer Design:

"If no key is provided, the default partitioner distributes messages round-robin to available partitions."

- * A is incorrect - not all go to partition 0.
- * C is invalid - Kafka doesn't group messages into one segment without a key.
- * D is false - ordering is not preserved across partitions without a key.
