## New Certification Development-Lifecycle-and-Deployment-Architect Book Torrent | Pass-Sure Development-Lifecycle-and-Deployment-Architect Latest Exam Review: Salesforce Certified Development Lifecycle and Deployment Architect 100% Pass

There is no denying the fact that everyone in the world wants to find a better job to improve the quality of life. Generally speaking, these jobs are offered only by some well-known companies. In order to enter these famous companies, we must try our best to get some certificates as proof of our ability such as the Development-Lifecycle-and-Deployment-Architect Certification. And our Development-Lifecycle-and-Deployment-Architect exam questions are the exactly tool to help you get the Development-Lifecycle-and-Deployment-Architect certification. Just buy our Development-Lifecycle-and-Deployment-Architect study materials, then you will win it.

## Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q121-Q126):

### NEW QUESTION # 121

Universal Containers has a highly customized Salesforce org, with many different pieces of configuration and code. Which configuration item should be covered by executable tests?

- A. Workflow Rules
- **B. Active Process Builders**
- C. Validation Rules
- D. Case Assignment Rules

**Answer: B**

Explanation:

Explanation

Active Process Builders are configuration items that should be covered by executable tests, as they can have complex logic and actions that affect the behavior and performance of the application. Validation Rules, Workflow Rules, and Case Assignment Rules are also configuration items, but they are simpler and less likely to cause errors or conflicts. Therefore, they can be verified by manual testing or declarative tools.

### NEW QUESTION # 122

Universal Containers (UC) is embarked on an enterprise Salesforce transformation journey, UC would like to streamline and automate deployment to different sandboxes during the build phase. Upon customer acceptance in UAT, the company requested to automate the production deployment as well.

As the deployment architect, what is the recommendation to satisfy the customer requirements?

- **A. Recommend using the Continuous integration and the Continuous deployment tool and build the pipeline to deploy to sandboxes and production.**
- B. Recommend using an AppExchange solution that packages the deployment components and you can run the deployment wizard to track deployment result.
- C. Recommend using the ANT script and build a custom application to run the script and use change sets to deploy supported metadata.
- D. Recommend using SFDX and documents the deployment commands with steps to be executed for each environment.

**Answer: A**

Explanation:

Explanation

The recommendation to satisfy the customer requirements is to use a Continuous Integration and Continuous Deployment tool and build the pipeline to deploy to sandboxes and production. A Continuous Integration and Continuous Deployment tool can automate the process of building, testing, and deploying the changes to different environments, as well as provide feedback and visibility into the deployment status and results. This can help to streamline and accelerate the deployment process, as well as to ensure consistency and quality across the environments. Using SFDX and documenting the deployment commands with steps to be executed for each environment is not a good recommendation, as it still requires manual intervention and execution, which can be error-prone and time-consuming. Using ANT script and building a custom application to run the script and use change sets to deploy supported metadata is not a good recommendation, as it involves using multiple tools and methods, which can increase the complexity and risk of the deployment process. Using an AppExchange solution that packages the deployment components and you can run the deployment wizard to track deployment result is not a good recommendation, as it may not support all the metadata types and features that need to be deployed, and it may not integrate well with the SFDX tools and methodologies that UC is using.

### NEW QUESTION # 123

Which two project situations favor an Agile methodology? Choose 2 answers

- **A. An environment with a heavy investment in DevOps capabilities for rapid testing and deployment**
- **B. A digitization project to update an existing customer-facing process and enable quick adjustments**
- C. A project with well-defined requirements and complex interactions between front- and back-end systems
- D. A project to be executed by a third party, with a fixed and formal scope, budget, and timeline

**Answer: A,B**

### NEW QUESTION # 124

Universal Containers' developers are working on a Visualforce page in a sandbox when an administrator adds a new field to Production. Which two approaches could an architect suggest to an administrator that would assist the developers in their development process? Choose 2 answers

- A. Use a Change Set to deploy the changes from Production to the sandbox, to ensure that changes made in production are reflected in the sandbox that the developers are working on
- B. Manually replicate the same changes in the developer sandbox to ensure that changes made in production are reflected in the sandbox that the developers are working on
- C. Use Salesforce-to-Salesforce to deploy the changes from Production to the sandbox, to ensure that changes made in production are reflected in the sandbox that the developers are working on
- D. Refresh the developer sandbox to ensure that changes made in production are reflected in the sandbox that the developers are working on

**Answer: A,B**

Explanation:

Explanation

Using a Change Set or manually replicating the changes in the developer sandbox are both valid approaches to ensure that changes made in production are reflected in the sandbox that the developers are working on.

Refreshing the developer sandbox would overwrite any changes made by the developers, and Salesforce-to-Salesforce is not a deployment tool.

### NEW QUESTION # 125

A developer on the Universal Containers team has written a test class to test a method that involves a web service callout. Within the test class, the developer is supposed to load test data, create an instance of the Mock object, set the Test.setMock() to that Mock object, call startTest(), execute the code that makes the callout, call stopTest(), and compare the result with expectations. Unfortunately, the Developer forgot to use the Test.setMock() method step.

What would happen when the developer runs this test class?

- A. The test class would make the web service callout and may or may not fail depending on the circumstances on the web service end
- B. The test class fails without error message since the test class will simply skip the web service callout during the execution.
- C. It is impossible to miss the Test.setMock() statement, the Developer Console will not let the developer save it since the test method callout
- D. The test class fails and the developer will see a message stating: Methods defined as TestMethod do not support Web service callouts.

**Answer: D**

### NEW QUESTION # 126

.....

If you are craving for getting promotion in your company, you must master some special skills which no one can surpass you. To suit your demands, our company has launched the Development-Lifecycle-and-Deployment-Architect exam materials especially for office workers. For on one hand, they are busy with their work, they have to get the Development-Lifecycle-and-Deployment-Architect Certification by the little spread time. On the other hand, it is not easy to gather all of the exam materials by themselves. So our Development-Lifecycle-and-Deployment-Architect study questions are their best choice.
