## Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q32-Q37):

### NEW QUESTION # 32

Which 3 secret stores are supported by Portworx?

- A. AWS KMS, Google Cloud KMS, Kubernetes Secrets
- B. AWS KMS, Oracle Key Vault, Hashicorp Vault
- C. IBM KMS, Hashicorp Vault, Gemalto SafeNet KeySecure

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx integrates with three primary external secret stores to manage encryption keys securely: AWS Key Management Service (AWS KMS), Google Cloud Key Management Service (Google Cloud KMS), and Kubernetes Secrets. AWS KMS enables secure key storage and management for workloads running in AWS, leveraging native cloud security features. Google Cloud KMS provides similar key management for Google Cloud environments, allowing seamless integration with Google's security infrastructure. Kubernetes Secrets provide an on-premises or hybrid cloud method to store encryption keys and sensitive configuration securely within Kubernetes clusters, suitable for private data centers or cloud-agnostic deployments. This multi-cloud and hybrid cloud compatibility enable Portworx to meet diverse customer requirements for key management and regulatory compliance. Portworx security documentation details the setup, configuration, and best practices for each supported secret store to ensure data encryption keys are managed securely and efficiently across environments **【Pure Storage Portworx Security Guide source】**.

### NEW QUESTION # 33

How should a Portworx administrator enable the Alertmanager?

- A. Deploy Alertmanager by following the official Alertmanager documentation and integrate it with Portworx by enabling monitoring webhook in the StorageCluster object.
- B. Create a config map with the Alertmanager configuration and enable Alertmanager via the pxctl CLI.
- C. Create a secret with the Alertmanager configuration and enable Alertmanager in the StorageCluster object.

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Enabling Alertmanager in Portworx involves creating a Kubernetes Secret containing the Alertmanager configuration (such as alert routing rules and notification channels) and referencing this secret in the Portworx StorageCluster manifest. This integration allows Portworx's monitoring stack to forward alerts to Alertmanager for centralized alert processing and notifications. Unlike ConfigMaps, which are generally used for non-sensitive data, Secrets protect sensitive alert configuration. Enabling Alertmanager via pxctl CLI is not supported as Portworx relies on Kubernetes declarative configuration for monitoring components. Additionally, deploying Alertmanager independently and integrating through webhooks requires manual setup but is not the recommended or integrated approach. Portworx official observability documentation details the secret-based configuration as the standard and secure method to enable and manage Alertmanager within Portworx clusters for robust alert handling **【Pure Storage Portworx Monitoring Guide source】** .

#### NEW QUESTION # 34

What is the minimum Stork version required to perform an Application Backup?

- A. Any Stork version works
- B. Stork 23.3.0
- **C. Stork 2.3**

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Stork version 2.3 is the minimum version required to support Application Backup features in Portworx. Application Backup allows for consistent snapshots and restores of complex, multi-volume, and multi-pod stateful applications. This capability depends on enhancements introduced in Stork 2.3 that enable application-aware backup orchestration, coordination between Kubernetes and storage layers, and integration with backup policies. Earlier Stork versions lack these features, making them unsuitable for application-level backups. Portworx release notes and Stork documentation confirm that version 2.3 introduced key functionalities that underpin the reliable backup and restore workflows for stateful workloads, making it a baseline requirement for disaster recovery and business continuity implementations involving application backups **【Pure Storage Portworx Backup Docs source】** .

#### NEW QUESTION # 35

What is a key benefit of using on-demand snapshots in a Kubernetes environment with Portworx?

- A. They automatically scale storage capacity.
- B. They require no additional configuration after the initial setup.
- **C. They provide immediate data recovery options without stopping applications.**

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

On-demand snapshots in Portworx allow administrators and applications to create point-in-time copies of volumes instantly without requiring downtime or interrupting running workloads. This capability is critical in Kubernetes environments where high availability and continuous operation are mandatory. Snapshots capture the exact state of data at a moment, enabling rapid recovery from accidental deletion, corruption, or ransomware attacks. Since these snapshots are created live, applications continue to run seamlessly, ensuring minimal impact on user experience. Portworx's snapshot technology uses efficient -on-write mechanisms, which also minimize storage overhead. Official Portworx documentation emphasizes that on-demand snapshots enhance data protection strategies by enabling quick backups and restores without requiring maintenance windows or complex scheduling **【Pure Storage Portworx Snapshot Guide source】** .

#### NEW QUESTION # 36

What are the three severity levels for Portworx alerts?

- A. INFO, WARNING, ALARM
- **B. INFO, WARNING, CRITICAL**

- C. INFO, WARNING, ERROR

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx classifies alerts into three main severity levels to help administrators prioritize response actions. These levels are INFO, WARNING, and CRITICAL. INFO alerts provide informational messages about non-critical events, such as configuration changes or normal operational milestones. WARNING alerts indicate potential issues that could impact performance or availability if left unaddressed, such as increased latency or approaching capacity limits. CRITICAL alerts signal severe problems requiring immediate attention, such as node failures or data corruption risks. This severity categorization supports effective alert management and escalation policies, allowing operational teams to focus on high-impact issues first. The Portworx observability and alerting guide explains these levels in detail and recommends integrating alerts with external monitoring systems for centralized management **【Pure Storage Portworx Alerting Guide source】**.
