Veeam Certified Engineer v12 Sample Questions (Q106-Q111):

NEW QUESTION # 106
Veeam Backup & Replication supports which of the following NetApp Data ONTAP modes?

- A. Only NatApp EDGE in 7-Mode
- B. Both 7-mode and Clustered Data ONTAP
- C. 7-mode only
- D. Clustered Data ONTAP only

Answer: B

NEW QUESTION # 107
Why is It recommended to have at least one backup proxy server in each site when defining a replica Job?

- A. The proxies allow replication automatic restart after failure.
- B. The proxies enable a stable connection for VM data transfer across sites.
- C. The proxies allow automatic WAN acceleration.
- D. The proxies allow for no VM snapshots during transit.

Answer: B

Explanation:
Explanation
A backup proxy is a component that acts as a data mover in the backup infrastructure. It retrieves data from the source and transfers it to the target1. When defining a replica job, it is recommended to have at least one backup proxy server in each site to enable a stable connection for VM data transfer across sites2. This way, the backup proxy at the source site can communicate with the backup proxy at the target site and send data over the WAN without affecting the production hosts2. The other options are not correct for explaining why backup proxies are recommended. The proxies do not allow automatic WAN acceleration, as this is a function of the WAN accelerators3. The proxies do not allow for no VM snapshots during transit, as the replication process requires creating a snapshot of the source VM to read its data. The proxies do not allow replication automatic restart after failure, as this is a setting of the replication job.

NEW QUESTION # 108
An engineer is using Veeam Backup and Replication v12.
The only backup repository is a Microsoft Windows server with direct attached Fibre Channel storage array.
The engineer realizes that none of their backups are immutable. A second copy of the backup on a different site and a different media is required.
Which option should be used to provide immutable backups on a secondary site with a different media?

- A. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and an HPe StoreOnce Catalyst share with immutability enabled as the capacity tier.
- B. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and AWS S3 bucket with immutability enabled as the capacity tier.
- C. Create a new hardened repository on a new Microsoft Windows Server, mark it as immutable and create a backup copy job on it.
- D. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and Google Cloud Object Storage with immutability enabled as the capacity tier.

Answer: B

Explanation:

To provide immutable backups on a secondary site with a different media, the best option given the context is B: Create a Scale Out Backup Repository (SOBR) with the existing Microsoft Windows Server as the performance tier and an AWS S3 bucket with immutability enabled as the capacity tier.

This approach involves leveraging the existing backup infrastructure (Microsoft Windows Server with direct-attached storage) as the performance tier of the SOBR, where the most recent backups are stored for fast access. For long-term storage and immutability, backups can be offloaded to an AWS S3 bucket configured with Object Lock. The Object Lock feature in AWS S3 provides an additional layer of data protection by making the backup data immutable, meaning it cannot be deleted or modified for a specified duration. This setup ensures that backup data is protected against accidental deletion, ransomware, and other malicious activities. By implementing this configuration, the engineer can achieve the desired level of data protection and immutability, utilizing cloud storage as a secure and scalable secondary backup location, distinct from the primary on-premises storage media.

NEW QUESTION # 109

A customer has been using an NFS repository in a high-capacity NAS device but is concerned about performance and security and complains that full backups require too much capacity.

What should the system engineer recommend?

- A. Deploy a hardened repository in a new server and use XFS with Fast Clone for synthetic full backups.
- B. Run the Security & Compliance Analyzer to get the best recommendation specific for the customer environment and use case.
- C. Enable deduplication on the NAS side, keep the same backup configuration so full backups will be completely deduplicated and take negligible capacity.
- D. Reduce the block size in the advanced job settings to improve data deduplication.

Answer: A

NEW QUESTION # 110

A company has an application on a VMware VM that stores customer photos. Customers may request their photos be removed at any time. The server needs to be restored from last week's backup. What Veeam restore process allows for custom scripting to be run to automatically remove any required photos before the server is returned to production?

- A. Instant VM Recovery
- B. Instant Disk Recovery
- C. Secure Restore
- D. Staged Restore

Answer: D

Explanation:
The Veeam restore process that allows for custom scripting to be run before returning a server to production is Staged Restore. This feature enables administrators to perform necessary operations, like running a script to remove customer photos, during the restore process before the VM is brought back online.
