ISA/IEC 62443 Cybersecurity Fundamentals Specialist Sample Questions (Q10-Q15):

NEW QUESTION # 10

What is OPC?

Available Choices (select all choices that are correct)

- A. An open standard serial communications protocol widely used in industrial manufacturing environments
- B. An open standard protocol for real-time field bus communication between automation technology devices
- C. An open standard protocol for the communication of real-time data between devices from different manufacturers
- D. A vendor-specific proprietary protocol for the communication of real-time plant data between control devices

Answer: C

NEW QUESTION # 11

According to the scheme for cybersecurity profiles, which of the following is true about ISA/IEC 62443 security requirements when creating a security profile?

- A. Only foundational requirements can be changed.
- B. No new requirements are added and existing ones are not modified.
- C. New security requirements can be added freely.
- D. Existing security requirements can be modified to fit sector needs.

Answer: B

Explanation:

ISA/IEC TR 62443-1-5 defines the rules for creating cybersecurity profiles. The key principle is preservation of standard integrity.

Step 1: Purpose of profiles

Profiles allow selection and scoping of existing requirements for specific industries or applications.

Step 2: Restriction on modification

The technical report explicitly states that no new security requirements may be added, and existing requirements must not be altered.

This ensures interoperability, auditability, and certification consistency.

Step 3: Correct approach

Profiles may select, exclude, or contextualize requirements, but they cannot redefine them.

Therefore, Option C is correct.

NEW QUESTION # 12

As related to IACS Maintenance Service Providers, when do maintenance activities generally start?

- A. Before the handover of the solution
- B. After the handover of the solution
- C. At the beginning of the project
- D. During the design phase

Answer: B

Explanation:

In the context of ISA/IEC 62443, maintenance activities by IACS Maintenance Service Providers generally begin after the solution (such as a control system or automation project) is handed over to the asset owner.

This marks the transition from project (installation and commissioning) to operational maintenance, which includes patching, updating, and other support activities as part of the system lifecycle.

Reference: ISA/IEC 62443-2-4:2015, Section 4.3.3 ("Service provider maintenance activities after handover").

NEW QUESTION # 13

Which communications system covers a large geographic area?

Available Choices (select all choices that are correct)

- A. Campus Area Network (CAN)
- B. Storage Area Network
- C. Wide Area Network (WAN)
- D. Local Area Network (LAN)

Answer: C

NEW QUESTION # 14

Which factor drives the selection of countermeasures?

Available Choices (select all choices that are correct)

- A. Security levels
- B. System design
- C. Foundational requirements
- D. Output from a risk assessment

Answer: D

Explanation:

The selection of countermeasures is driven by the output from a risk assessment, which identifies the risks and their associated likelihood and consequences for each zone and conduit in the industrial automation and control system (IACS). The risk assessment also determines the target security level (SL-T) for each zone and conduit, which represents the desired level of protection against the identified threats. The countermeasures are then selected based on the SL-T and the existing security level (SL-A) of the zone and conduit, as well as the cost and feasibility of implementation. The countermeasures should aim to reduce the risk to an acceptable level by increasing the SL-A to meet or exceed the SL-T.
