NEW QUESTION # 41

An organization's IT team follows an API-led connectivity approach and must use Anypoint Platform to implement a System API that securely accesses customer data. The organization uses Salesforce as the system of record for all customer data and its most important objective is to reduce the overall development time to release the System API. The team's integration architect has identified four different approaches to access the customer data from within the implementation of the System API by using different Anypoint Connectors that all meet the technical requirements of the project. Which approach should the team choose to meet the organization's objective to reduce the time to develop and release the System API?

- A. Use the Anypoint Connector for FTP to download a file containing a recent near-real time extract of the customer data
- **B. Use the Anypoint Connector for Salesforce to connect to the Salesforce APIs to directly access the customer data**

- C. Use the Anypoint Connector for HTTP to connect to the Salesforce APIs to directly access the customer data
- D. Use the Anypoint Connector for Database to connect to a MySQL database to access a copy of the customer data

Answer: B

Explanation:

In an API-led connectivity approach, using the most efficient method to access system data can significantly reduce development time. Here's why using the Anypoint Connector for Salesforce is the best approach:

Direct Access:

Salesforce APIs: The Anypoint Connector for Salesforce provides direct access to Salesforce APIs, allowing the System API to retrieve customer data efficiently and securely.

No Middleware: Directly accessing Salesforce eliminates the need for intermediary steps, reducing complexity and potential points of failure.

Reduced Development Time:

Out-of-the-Box Functionality: The connector offers pre-built operations and functionalities tailored for Salesforce, speeding up development.

Configuration Over Coding: Using the connector involves minimal configuration compared to coding custom integration logic, leading to faster implementation.

Security:

Built-in Security: The connector handles authentication and authorization, ensuring secure data access in line with Salesforce security protocols.

Alternative Approaches:

HTTP Connector: While functional, it requires more custom handling for Salesforce API interactions and error management.

Database Connector: Accessing a database copy of Salesforce data may involve data synchronization challenges and does not provide real-time data.

FTP Connector: Using FTP for data extracts is less efficient and introduces delays in accessing up-to-date information.

MuleSoft Documentation: Salesforce Connector

API-led Connectivity: MuleSoft API-led Connectivity
