You can ask for a full refund once you show us your unqualified transcript to our staff. The whole process is time-saving and brief, which would help you pass the next SPLK-1004 Exam successfully. Please contact us through email when you need us. Our purchasing process is designed by the most professional experts, that's the reason why we can secure your privacy while purchasing our SPLK-1004 test guide.

Splunk Core Certified Advanced Power User Sample Questions (Q49-Q54):

NEW QUESTION # 49

What is one way to troubleshoot dashboards?

- A. Delete the dashboard and start over.
- **B. Go to the Troubleshooting dashboard of the Searching and Reporting app.**
- C. Create an HTML panel using tokens to verify that they are being set.
- D. Run the `| previous_searches` command to troubleshoot your SPL queries.

Answer: B

Explanation:

To troubleshoot dashboards in Splunk, one effective approach is to go to the Troubleshooting dashboard of the Search & Reporting app (Option B). This dashboard provides insights into the performance and potential issues of other dashboards and searches, offering a centralized place to diagnose and address problems. This method allows for a structured approach to troubleshooting, leveraging built-in tools and reports to identify and resolve issues.

NEW QUESTION # 50

Which of the following can be used to access external lookups?

- A. Python and Ruby
- **B. Python and binary executable**
- C. Perl and Python
- D. Perl and binary executable

Answer: B

Explanation:

Splunk supports the use of external lookups, which can be scripts or binary executables that enrich search results with external data. These external lookups can be written in various scripting languages or compiled as binary executables. Among the options given, Python and binary executables (Option D) are commonly used for creating external lookups in Splunk. Python is a widely used programming language that can easily interact with Splunk's API and data structures, and binary executables can be used for more complex or performance-critical lookup operations. Perl and Ruby (Options A and B) are less commonly used in this context, and Perl combined with binary executables (Option C) is not as standard for Splunk external lookups as Python.

NEW QUESTION # 51

How is a multivalue field treated from `product="a, b, c, d"`?

- **A. ... | makemv delim="," product**
- B. ... | mvexpand product
- C. ... | makemv delim{product, ","}
- D. ... | eval mvexpand{makemv{product, ","}}

Answer: A

Explanation:

The `makemv` command with `delim=","` is used to split a multivalue field like `product="a, b, c, d"` into separate values, making it easier to manipulate each value individually.

NEW QUESTION # 52

Which is a regex best practice?

- A. Use complex expressions rather than simple ones.
- B. Use `*` rather than `+`.
- C. Use greedy operators (`.` `*`) instead of non-greedy operators (`.` `*?`).
- **D. Avoid backtracking.**

Answer: D

Explanation:

In regex (regular expressions), one of the best practices is to avoid backtracking when possible. Backtracking occurs when the regex engine revisits previous parts of the input string to attempt different permutations of the pattern, which can significantly degrade performance, especially with complex patterns on large inputs.

Designing regex patterns to minimize or avoid backtracking can lead to more efficient and faster evaluations.

NEW QUESTION # 53

When using the bin command, what attributes are used to define the size and number of sets?

- **A. bins and span**
- B. bins and minspan
- C. bins and start and end
- D. bins and limit

Answer: A

Explanation:

The bin command in Splunk is used to group continuous numerical values into discrete buckets or bins. The span attribute defines the size of each bin, while the bins attribute specifies the number of bins to create.

For example:

```
spl
```

Copy

```
| bin span=10ms bins=5 duration
```

This command creates 5 bins, each spanning 10 milliseconds, for the duration field.
