## 3V0-21.23 Test Lab Questions | 3V0-21.23 Valid Test Notes

3V0-21.23 certification exam is a very import component VMware certification exam. But passing VMware certification 3V0-21.23 exam is not so simple. In order to give to relieve pressure and save time and effort for candidates who take a preparation for the 3V0-21.23 Certification Exam, Itcerttest specially produce a variety of training tools. So you can choose an appropriate quick training from Itcerttest to pass the exam.

### VMware vSphere 8.x Advanced Design Sample Questions (Q83-Q88):

#### NEW QUESTION # 83

Which VMware product offers a software-defined storage solution, providing distributed storage architecture that spans multiple vSphere clusters?

- A. VMware Workstation
- B. NSX-T
- C. vSphere Replication
- D. vSAN**

**Answer: D**

#### NEW QUESTION # 84

An architect is holding a design workshop with a customer for a new solution. The customer states that the new solution needs to provide the following capabilities:

Automated deployment and lifecycle management of the vSphere platform

Self-Service deployment of virtual machines and other objects from a central catalog Monitoring, logging and analytic tooling to provide visibility and troubleshooting of the whole solution Support deployment via infrastructure-as-code methods for the additional management components The customer also requests that the solution be as cost-effective as possible while still delivering a fast time to value for the organization.

Which design approach should the architect recommend to meet these requirements?

- A. Use VMware Cloud Foundation for the vSphere solution and a custom design for the additional components
- B. Use a custom design for the vSphere solution and VMware Validated Solutions for the additional components
- **C. Use VMware Cloud Foundation for the vSphere solution and VMware Validated Solutions for the additional components**
- D. Use VMware Validated Designs for the vSphere solution and VMware Validated Solutions for the additional components

**Answer: C**

Explanation:

The customer has outlined the following requirements:

Automated deployment and lifecycle management of the vSphere platform: This requires a solution that provides automated provisioning, management, and updates. VMware Cloud Foundation (VCF) is an integrated platform that provides automation for the lifecycle of the vSphere platform, including updates and patch management.

Self-Service deployment of virtual machines and other objects from a central catalog: VMware Cloud Foundation includes tools like vRealize Automation (part of VCF) that enable self-service provisioning of virtual machines and other resources. Additionally, VCF provides centralized management for provisioning and orchestration.

Monitoring, logging, and analytic tooling for visibility and troubleshooting: VMware Cloud Foundation integrates with vRealize Operations and vRealize Log Insight, which provides visibility, monitoring, and logging capabilities for the entire solution. These tools help in analytics and troubleshooting across the entire infrastructure.

Support deployment via infrastructure-as-code methods for additional management components: VMware Validated Solutions (such as vRealize Automation or vRealize Orchestrator) provide infrastructure-as-code capabilities, ensuring that the solution can be deployed in a consistent, repeatable manner, automating deployments of not just vSphere but also additional management components.

Cost-effectiveness with a fast time to value: VMware Cloud Foundation offers an integrated solution that is pre-configured and validated, which speeds up deployment and reduces operational complexity. By using VMware Validated Solutions for additional management components, the customer can leverage existing, tested solutions that are optimized for use with VCF, ensuring cost-effectiveness while meeting requirements.

## NEW QUESTION # 85

During the upgrade process of VMware tools on virtual machines, what is the correct sequence to ensure smooth compatibility?

- A. Upgrade the vSphere Client first, followed by the ESXi hosts and then the virtual machines
- **B. Upgrade the virtual machines first, followed by the ESXi hosts and then the vCenter Server**
- C. Upgrade the vCenter Server first, followed by the ESXi hosts and then the virtual machines
- D. Upgrade the ESXi hosts first, followed by the virtual machines and then the vCenter Server

**Answer: B**

## NEW QUESTION # 86

An architect is tasked with creating a design for a vSphere-based solution.

Reviewing requirements with the security team, the architect makes the following design decision:

ESXi hosts in the environment will enable shell sandbox for SSH connections and the local ESXi shell What is an implication of the design decision to enable shell sandboxing?

- A. All commands executed in the sandbox shell will be logged
- B. The vSphere 8 hosts will operate in strict lockdown mode
- **C. Only certain commands can be executed in the sandboxed shell**
- D. Only administrative accounts can access the sandbox shell

**Answer: C**

#### Explanation:

When the shell sandbox is enabled on ESXi hosts, it restricts the execution of commands within the shell to ensure that only authorized or safe commands are allowed. This provides a level of isolation that limits the potential for accidental or malicious commands to be run in the shell, enhancing security while still providing necessary administrative access.

#### NEW QUESTION # 87

An architect is tasked with reviewing the design of a VMware software-defined data center (SDDC) for a software development company. The platform is used to developing applications and services.

It is important that the customer be able to accurately benchmark performance of developed applications. The platform has recently commissioned new hosts to update the development cluster.

The development cluster host configuration is:

- 4 ESXi hosts with 2 sockets  $\times$  16 cores
- 512 GB RAM divided evenly between sockets
- There is no resource contention

The benchmarking cluster host configuration is:

- 8 ESXi hosts with 2 sockets  $\times$  8 cores
- 256 GB RAM divided evenly between sockets
- There is no resource contention

The customer is developing an application that includes a database virtual machine. The application developer states that the database virtual machine performs as required only when allocated 8 vCPUs

256 GB RAM.

The database virtual machine performance meets the required levels when run from the development cluster. Performance benchmarking for the database virtual machine yields highly variable results when run from the benchmarking cluster.

The application cannot be released without reliable performance benchmarking data.

What is a possible reason for the difference in performance test results between the development and benchmarking clusters?

- A. The development cluster can support a lower %Ready time per vCPU
- B. **The database tier breaches a single NUMA node boundary for the benchmarking cluster**
- C. The database tier breaches a single NUMA node boundary for the development cluster
- D. The development cluster has more available RAM per host

**Answer: B**
