

# AWS Certified Security–Specialty exam questions & SCS-C03 torrent vce & AWS Certified Security–Specialty pdf dumps

Computer brings more convenience, online access to information, published an article, watch movies, online remote virtual learning and other benefits. IT workers are becoming high-salary field in all over the world. Itcertkey releases latest and valid SCS-C03 Exam preparations to help candidates clear exams certainly as Amazon certifications are outstanding and attractive. If you determine to take part in exams, our SCS-C03 exam preparations will be a good helper.

In today's competitive industry, only the brightest and most qualified candidates are hired for high-paying positions. Obtaining SCS-C03 is a wonderful approach to be successful because it can draw in prospects and convince companies that you are the finest in your field. Pass the SCS-C03 Exam to establish your expertise in your field and receive certification. However, passing the AWS Certified Security – Specialty SCS-C03 exam is challenging.

## SCS-C03 Valid Exam Questions & SCS-C03 Study Pdf Vce & SCS-C03 Latest Study Guide

The Itcertkey SCS-C03 Practice Questions are designed and verified by experienced and renowned SCS-C03 exam trainers. They work collectively and strive hard to ensure the top quality of SCS-C03 exam practice questions all the time. The SCS-C03 Exam Questions are real, updated, and error-free that helps you in Amazon SCS-C03 exam preparation and boost your confidence to crack the upcoming SCS-C03 exam easily.

### Amazon AWS Certified Security – Specialty Sample Questions (Q59-Q64):

#### NEW QUESTION # 59

A company must immediately disable compromised IAM users across all AWS accounts and collect all actions performed by the user in the last 7 days.

Which solution will meet these requirements?

- A. Disable the user in IAM Identity Center and query the organizational event data store.
- B. Remove IAM policies and query logs in Security Hub.
- C. Remove permission sets and query logs using CloudWatch Logs Insights.
- D. Disable the IAM user and query CloudTrail logs in Amazon S3 using Athena.

**Answer: A**

Explanation:

AWS IAM Identity Center centrally manages user access across an AWS Organization. Disabling the user in Identity Center immediately revokes access to all AWS accounts. According to AWS Certified Security - Specialty documentation, organizational CloudTrail event data stores provide centralized, queryable access to all events across accounts.

Using CloudTrail Lake enables direct querying of activity without exporting logs. Disabling the user at the Identity Center level ensures full containment.

### NEW QUESTION # 60

A company needs centralized log monitoring with automatic detection across hundreds of AWS accounts.

Which solution meets these requirements with the LEAST operational effort?

- A. Designate a GuardDuty administrator account and enable protections.
- B. Centralize CloudWatch logs and use Inspector.
- C. Stream logs to Kinesis and process with Lambda.
- D. Centralize CloudTrail logs and query with Athena.

**Answer: A**

Explanation:

Amazon GuardDuty provides fully managed threat detection across accounts when configured with delegated administration. EKS and RDS protections enable workload-aware detection with minimal setup.

Other solutions require custom pipelines and higher operational overhead.

### NEW QUESTION # 61

A company has a web application that reads from and writes to an Amazon S3 bucket. The company needs to authenticate all S3 API calls with AWS credentials.

Which solution will provide the application with AWS credentials?

- A. Use Amazon Cognito identity pools and AssumeRoleWithWebIdentity.
- B. Use Amazon Cognito user pools with ID tokens.
- C. Use Amazon Cognito user pools with access tokens.
- D. Use Amazon Cognito identity pools and the GetId API.

**Answer: A**

Explanation:

Amazon Cognito identity pools provide temporary AWS credentials by exchanging web identity tokens with AWS STS using AssumeRoleWithWebIdentity. According to AWS Certified Security - Specialty documentation, this is the correct mechanism for granting applications AWS credentials.

User pools authenticate users but do not issue AWS credentials. Identity pools integrate with IAM roles and STS, enabling secure, temporary access to AWS services.

### NEW QUESTION # 62

A security engineer wants to forward custom application-security logs from an Amazon EC2 instance to Amazon CloudWatch. The security engineer installs the CloudWatch agent on the EC2 instance and adds the path of the logs to the CloudWatch configuration file.

However, CloudWatch does not receive the logs. The security engineer verifies that the awslogs service is running on the EC2 instance.

What should the security engineer do next to resolve the issue?

- A. Add Amazon Inspector to the trust policy of the EC2 instance. Use Amazon Inspector instead of the CloudWatch agent to collect the custom logs.
- B. **Attach the CloudWatchAgentServerPolicy AWS managed policy to the EC2 instance role.**
- C. Add AWS CloudTrail to the trust policy of the EC2 instance. Send the custom logs to CloudTrail instead of CloudWatch.
- D. Add Amazon S3 to the trust policy of the EC2 instance. Configure the application to write the custom logs to an S3 bucket that CloudWatch can use to ingest the logs.

**Answer: B**

Explanation:

The Amazon CloudWatch agent requires explicit IAM permissions to create log groups, create log streams, and put log events into Amazon CloudWatch Logs. According to the AWS Certified Security - Specialty Study Guide, the most common cause of CloudWatch agent log delivery failures is missing or insufficient IAM permissions on the EC2 instance role.

The CloudWatchAgentServerPolicy AWS managed policy provides the required permissions, including logs:

CreateLogGroup, logs:CreateLogStream, and logs:PutLogEvents. Attaching this policy to the EC2 instance role enables the CloudWatch agent to successfully deliver custom application logs without requiring changes to the application or logging configuration.

Options A, B, and C are incorrect because CloudTrail, Amazon S3, and Amazon Inspector are not designed to ingest custom application logs from EC2 instances in this manner. AWS documentation clearly states that IAM permissions must be granted to the EC2 role for CloudWatch Logs ingestion.

This approach aligns with AWS best practices for least privilege while ensuring reliable detection and monitoring capabilities.

AWS IAM Best Practices for Monitoring

**NEW QUESTION # 63**

AWS Config cannot deliver configuration snapshots to Amazon S3.

Which TWO actions will remediate this issue?

- A. Verify the S3 bucket can assume the IAM role.
- B. **Verify the IAM role has s3:GetBucketAcl and s3:PutObject permissions.**
- C. **Verify the S3 bucket policy allows config.amazonaws.com**
- D. Verify IAM policy allows AWS Config to write logs.
- E. Modify AWS Config API permissions.

**Answer: B,C**

Explanation:

AWS Config requires permissions at two levels to deliver configuration data: the AWS Config service role and the S3 bucket policy. The AWS Certified Security - Specialty Study Guide states that the S3 bucket policy must explicitly allow the config.amazonaws.com service principal to write objects. Additionally, the IAM role used by AWS Config must allow s3:GetBucketAcl and s3:PutObject.

If either permission is missing, AWS Config cannot deliver snapshots and will log delivery errors in CloudTrail. This dual-permission model ensures least privilege while maintaining secure delivery of compliance data.

Other options reference incorrect principals or irrelevant permissions.
