## Microsoft GH-200 Latest Braindumps Files | Pass GH-200 Test

The meaning of qualifying examinations is, in some ways, to prove the candidate's ability to obtain qualifications that show your ability in various fields of expertise. If you choose our GH-200 study materials, you can create more unlimited value in the limited study time, learn more knowledge, and take the exam that you can take. Through qualifying examinations, this is our GH-200 Study Materials and the common goal of every user, we are trustworthy helpers, so please don't miss such a good opportunity.

## Microsoft GitHub Actions Sample Questions (Q94-Q99):

### NEW QUESTION # 94

As a DevOps engineer, you need to define a deployment workflow that runs after the build workflow has successfully completed. Without modifying the build workflow, which trigger should you define in the deployment workflow?

- A. repository\_dispatch
- B. workflow\_dispatch
- C. workflow\_exec
- D. workflow\_run

**Answer: D**

Explanation:

A deployment workflow can be started after a build workflow has finished by using the workflow\_run event in the deployment workflow's on trigger. You must specify the name of the build workflow you want to trigger on and use an if condition to ensure the deployment workflow only runs if the build workflow successfully completes.

Here's how to set it up:

In your deployment workflow file: (e.g., deploy.yml), define the on: trigger.

Use the workflow\_run event: within the on: trigger.

Specify the build workflow: by its name.

Add a conditional if statement: to the workflow to check the conclusion of the workflow\_run event, ensuring it equals 'success'.

### NEW QUESTION # 95

How many jobs will result from the following matrix configuration?

```
strategy:
  matrix:
    color: [green, pink]
    animal: [owl, magpie]
  include:
    - color: blue
      animal: owl
    - color: pink
      animal: magpie
```

- A. 6 jobs
- B. 3 jobs
- C. 4 jobs
- D. 5 jobs

**Answer: A**

Explanation:

The matrix configuration specifies two variables: color and animal. The color variable has 2 values (green and pink), and the animal variable has 2 values (owl and magpie). This would result in 4 combinations (2 color values × 2 animal values). Additionally, the include section introduces two more combinations (color: blue and animal: owl; color: pink and animal: magpie).

### NEW QUESTION # 96

You have exactly one Windows x64 self-hosted runner, and it is configured with custom tools. Which syntax could you use in the workflow to target that runner?

- A. runs-on: windows-latest
- **B. runs-on: [self-hosted, windows, x64]**
- C. self-hosted: [windows, x64]
- D. self-hosted: [windows-x64]

**Answer: B**

Explanation:

The runs-on keyword allows you to specify the operating system and other labels for the runner. By specifying self-hosted, windows, and x64, you are targeting a self-hosted Windows runner that matches these criteria, which aligns with the custom configuration of your self-hosted runner.

#### NEW QUESTION # 97

Which of the following scenarios would require the use of self-hosted runners instead of GitHub-hosted runners?

- **A. running more than the three concurrent workflows supported by GitHub-hosted runners**
- B. performing builds on macOS
- C. using Docker containers as part of the workflow
- **D. using specialized hardware configurations required for workflows**
- E. exceeding 50,000 monthly minutes of build time

**Answer: A,D**

Explanation:

GitHub-hosted runners have a limit on the number of concurrent workflows (typically 20 for free-tier accounts and 5 for enterprise). If your organization needs to run more workflows simultaneously, you would need to use self-hosted runners to increase the available concurrency.

Self-hosted runners allow you to configure specialized hardware or software setups that are necessary for certain workflows.

GitHub-hosted runners may not have access to custom hardware configurations like GPUs or other specialized resources, so self-hosted runners are required in such cases.

#### NEW QUESTION # 98

Which syntax correctly accesses a job output (output1) of an upstream job (job1) from a dependent job within a workflow?

- A. `${{job1.outputs.output1}}`
- B. `${{depends.job1.output1}}`
- **C. `${{needs.job1.outputs.output1}}`**
- D. `${{needs.job1.output1}}`

**Answer: C**

Explanation:

The needs context is used to reference the outputs of jobs that are dependencies of the current job. In this case, `needs.job1.outputs.output1` correctly accesses the output of `output1` from the job `job1` in the dependent job.

#### NEW QUESTION # 99

.....

To assimilate those useful knowledge better, many customers eager to have some kinds of practice materials worth practicing. All content is clear and easily understood in our GH-200 practice materials. They are accessible with reasonable prices and various versions for your option. All content are in compliance with regulations of the exam. As long as you are determined to succeed, our GH-200 Study Guide will be your best reliance
