

Trustworthy VMware 3V0-23.25 Exam Content, 3V0-23.25 Braindump Free

After a short time's studying and practicing with our 3V0-23.25 exam questions, you will easily pass the examination. We can claim that if you study with our 3V0-23.25 learning quiz for 20 to 30 hours, then you will be confident to attend the exam. God helps those who help themselves. If you choose our 3V0-23.25 Study Materials, you will find God just by your side. The only thing you have to do is just to make your choice and study. Isn't it very easy? So know more about our 3V0-23.25 practice guide right now!

Developing your niche is very easy in the presence of the 3V0-23.25 dumps. The credentials are not very difficult to achieve because like 3V0-23.25 the acclaimed vendors are highly successful in the industry. If you need a boost in your career, then Fast2test is the site you have to opt for taking 3V0-23.25 Certification exams. Some of the vital features of the 3V0-23.25 dumps of Fast2test are given below. 3V0-23.25 dumps are the most verified and authentic braindumps that are used to pass the 3V0-23.25 certification exam. The whole 3V0-23.25 study material is approved by the expert.

Free PDF Marvelous VMware - 3V0-23.25 - Trustworthy Advanced VMware Cloud Foundation 9.0 Storage Exam Content

As old saying goes, no pains, no gains. You must depend on yourself to acquire what you want. No one can substitute you with the process. Of course, life has shortcut, which can ensure you have a bright future. Our 3V0-23.25 training quiz will become your new hope. As the most popular exam provider in the market, we are warmly praised and we can receive thousands of the grateful feedbacks from our worthy customers on 3V0-23.25 Exam Questions. please trust and buy our 3V0-23.25 study materials!

VMware Advanced VMware Cloud Foundation 9.0 Storage Sample Questions (Q93-Q98):

NEW QUESTION # 93

A Cloud Administrator configures a Secure Disaster Recovery topology for a VCF 9.0 environment.

The Primary Site uses a vSAN ESA cluster with Data-at-Rest Encryption enabled. The Secondary Site also uses vSAN ESA with Data-at-Rest Encryption.

The Administrator configures vSphere Replication to replicate a Tier-1 VM from Primary to Secondary.

...

[Storage Policy Rule Set]

Source SPBM: ESA-RAID5-Encrypted

Target SPBM: ESA-RAID6-Encrypted

...

How is the data security handled throughout the lifecycle of this replication process, from source disk to target disk? (Select all that apply.)

- A. The encrypted data blocks are sent raw across the wire; the target vSAN cluster must import the Primary Site's Key

Encryption Key (KEK) to read the data.

- B. Upon arrival at the Secondary site, the target vSAN datastore encrypts the incoming data using the Secondary site's own local Disk Encryption Keys (DEKs) before destaging it to NVMe.
- C. To secure the data in transit across the WAN, the administrator must explicitly enable "Network Traffic Encryption" in the vSphere Replication advanced settings for the VM.
- D. The VM's data is decrypted by the source ESXi host as it is read from the vSAN datastore, and enters the vSphere Replication appliance network buffer in cleartext.
- E. vSphere Replication automatically maps the source Guest OS bitlocker keys to the target site using the vCenter API.

Answer: B,C,D

NEW QUESTION # 94

A Compliance Auditor is reviewing the Site Recovery Manager (SRM) Disaster Recovery plan encoded in YAML for a VCF 9.0 implementation.

The environment uses standard vSphere Replication (not Stretched Clustering) to protect workloads between the Primary and Secondary vSAN domains.

```
...  
# SRM Protection Group: Financial-Tier1  
name: "Fin-PG-01"  
replication_type: "vSphere_Replication"  
datastores:  
- source: "vsanDatastore-Primary"  
  target: "vsanDatastore-DR"  
storage_policy_mapping:  
- source_policy: "FTT=1 (RAID-1)"  
  target_policy: "FTT=2 (RAID-6)"  
...
```

How does the target_policy specification interact with the vSAN Distributed Object Manager (DOM) during the actual SRM failover event?

- A. The target policy forces the secondary site to convert the vSAN datastore into a standard VMFS volume to accept the incoming replicated data stream.
- B. During the failover, the Secondary vCenter provisions the recovered VMDKs directly onto the "vsanDatastore-DR" using the "FTT=2 (RAID-6)" rule, ensuring the data is instantly protected by local erasure coding upon boot.
- C. SRM ignores the target_policy because vSphere Replication automatically clones the identical physical geometry of the source vSAN datastore to the target site.
- D. The configuration is invalid; SRM requires identical policies at both the source and target sites to maintain the replication checksums.

Answer: B

NEW QUESTION # 95

A CTO is evaluating the performance metrics of the new vSAN ESA clusters in VCF 9.0.

The traditional SAN storage array historically suffered from "RAID-5 Write Penalties" where backend disk IOPS significantly exceeded front-end application IOPS. The CTO analyzes the ESA log-structured metrics via the configuration YAML export.

```
...  
# vSAN ESA Performance Matrix  
DOM Frontend (VM) Writes: 10,000 IOPS (Random 4KB)  
SPBM Policy: RAID-5 (4+1 Configuration)  
LSOM Backend (Disk) Writes: 1,500 IOPS (Sequential 1MB)  
...
```

How does vSAN ESA fundamentally eliminate the backend performance bottleneck associated with traditional Erasure Coding (RAID-5/6)? (Select all that apply.)

- A. ESA strictly enforces RAID-1 mirroring for databases, making the RAID-5 data comparison irrelevant.
- B. The system uses a persistent flash memory layer physically connected to the RAID controller to absorb parity operations.
- C. Because data is written in new, full sequential stripes, the NVMe drives never have to read the old data and old parity.

blocks first, completely eliminating the "Read-Modify-Write" penalty.

- D. Reducing 10,000 application IOPS down to 1,500 physical NVMe IOPS relieves backend congestion, ensuring the physical NVMe drives are utilized efficiently and never become the bottleneck.
- E. The ESA log-structured filesystem buffers the 10,000 small random 4KB writes in memory and coalesces (packs) them into a small number of large 1MB sequential blocks.

Answer: C,D,E

NEW QUESTION # 96

A SOC Analyst is investigating a massive CPU utilization spike on a VCF 9.0 ESXi host immediately after a Supplemental NFS v4.1 Datastore was mounted. The principal storage is vSAN ESA.

...

[Log Snippet: vmkernel.log - ESXi Host]

2026-11-20T11:00:00Z INFO tcp_ip - [NFS] IP Fragmentation event detected.

2026-11-20T11:00:05Z WARN cpu_sched - [Hostd] CPU 01 saturation: 99% (Processing network interrupts).

...

The Physical Network switch is configured for standard MTU 1500.

What is strictly causing this configuration to cripple the ESXi host CPU, assuming the storage traffic is high volume? (Select all that apply.)

- A. Because the host is sending 9000-byte packets and the physical switch only supports 1500-byte packets, the ESXi network stack is forced to violently fragment every storage packet into 6 smaller packets.
- B. The CPU is consumed by the Top-of-Rack switch's native ASIC routing protocol.
- C. The ESXi host automatically triggers a "Deep Rekey" operation when MTU mismatches are detected to ensure the fragmented packets remain encrypted.
- D. The fragmentation and subsequent reassembly of massive NFS payload data consumes astronomical amounts of ESXi CPU cycles (Interrupt Requests), starving the hostd management agent and the vSAN DOM of compute resources.
- E. The VMkernel port used for the NFS datastore was mistakenly configured with MTU 9000 (Jumbo Frames).

Answer: A,D,E

NEW QUESTION # 97

An Infrastructure Manager is utilizing the vSphere Lifecycle Manager (vLCM) in SDDC Manager to perform a firmware upgrade on the physical NVMe drives in a vSAN ESA cluster.

...

vLCM Desired State Specification (JSON)

```
{
```

```
"esx_version": "8.0U2",
```

```
"vendor_addon": "DellEMC-OpenManage-v10",
```

```
"firmware_baseline": "Dell-NVMe-Gen4-v5.3.1"
```

```
}
```

...

How does vLCM natively handle the disruption of upgrading live NVMe firmware inside a running vSAN Express Storage Architecture cluster?

- A. The firmware is upgraded directly from the physical Top-of-Rack network switches via Redfish protocol, bypassing the ESXi hypervisor entirely.
- B. vLCM automatically copies all virtual machines to the remote vSphere Replication site before initiating the firmware flash to protect the data layer.
- C. NVMe firmware upgrades are strictly "Hot-Add" and do not require ESXi host reboots or Maintenance Mode, allowing the drives to flash in the background without user intervention.
- D. vLCM orchestrates the process by sequentially putting one host at a time into Maintenance Mode (using Ensure Accessibility), applying the new firmware payload via the Hardware Support Manager (HSM), and rebooting the host to initialize the NVMe controllers.

Answer: D

NEW QUESTION # 98

.....

One of the key factors for passing the exam is practice. Candidates must use VMware 3V0-23.25 practice test material to be able to perform at their best on the real exam. This is why Fast2test has developed three formats to assist candidates in their VMware 3V0-23.25 Preparation. These formats include desktop-based VMware 3V0-23.25 practice test software, web-based practice test, and a PDF format.
