2026 VCESoft最新的ACD201 PDF版考試題庫和ACD201考試問題和答案免費分享：<https://drive.google.com/open?id=14ffBe6f6MQMaVImNBLHNO5ytKSrV1gdg>

揮灑如椽之巨筆譜寫生命之絢爛華章，讓心的小舟在波瀾壯闊的汪洋中乘風破浪，直濟滄海。如何才能到達天堂，捷徑只有一個，那就是使用VCESoft Appian的ACD201考試培訓資料。這是我們對每位IT考生的忠告，希望他們能抵達夢想的天堂。

Appian ACD201 考試大綱：

主題	簡介
主題 1	Application Design and Development: This section of the exam measures the skills of Appian Developers and covers translating business requirements into user stories, building end-to-end applications, managing object security, applying design best practices, and ensuring user-centric experiences through proper UX design.
主題 2	Advanced Appian Concepts: This section of the exam measures the skills of Solution Architects and covers creating and configuring authentication methods, setting up integration objects, designing APIs, evaluating smart services and plug-ins, and applying SSO mechanisms with SAML and LDAP.

主題 3	Performance and Scalability: This section of the exam measures the skills of Appian Developers and covers designing performant components, building memory-efficient models, conducting database load and automated testing, analyzing server memory and logs for risks, and resolving performance concerns for end users.
主題 4	Data Management: This section of the exam measures the skills of Solution Architects and covers designing and documenting data models, recommending record types for optimization and security, working with relational data, and implementing complex models with supporting objects.

ACD201測試 & ACD201題庫分享

現在有許多IT培訓機構都能為你提供Appian ACD201 認證考試相關的培訓資料，但通常考生通過這些網站得不到詳細的資料。因為他們提供的關於Appian ACD201 認證考試資料都比較寬泛，不具有針對性，所以吸引不了考生的注意力。

最新的 Senior Developer ACD201 免費考試真題 (Q28-Q33):

問題 #28

An insurance application has a dashboard in which all the cases with "Accident" case type and "Health Insurance" insurance type are displayed to the user, using the following query:

```
alquery(
  logicalExpression: alqueryLogicalExpression(
    operator: "AND",
    filters: {
      alqueryFilter(
        field: "caseType",
        operator: "=",
        value: "Accident"
      ),
      alqueryFilter(
        field: "insuranceType",
        operator: "=",
        value: "Health Insurance"
      )
    }
  ),
  pagingInfo: alpagingInfo(
    startIndex: 1,
    batchSize: 10,
    sort: alsortInfo(
      field: "createdDate"
    )
  )
)
```

You need to update the query entity to display all the cases that are "Accident" case type and "Health Insurance" insurance type, or created in the last ten days.

What is the right configuration for the logical expression?

```
alqueryLogicalExpression(
  operator: "AND",
  filters: {
    alqueryFilter(
      field: "caseType",
      operator: "=",
      value: "Accident"
    ),
    alqueryFilter(
      field: "insuranceType",
      operator: "=",
      value: "Health Insurance"
    ),
    alqueryFilter(
      field: "createdDate",
      value: today() - 10,
      operator: ">="
    )
  }
)
```

- A.

```

alqueryLogicalExpression(
  operator: "OR",
  filters: alqueryFilter(
    field: "createdDate",
    value: today() - 10,
    operator: ">="
  ),
  logicalExpressions: alqueryLogicalExpression(
    operator: "AND",
    filters: {
      alqueryFilter(
        field: "caseType",
        operator: "=",
        value: "Accident"
      ),
      alqueryFilter(
        field: "insuranceType",
        operator: "=",
        value: "Health Insurance"
      )
    }
  )
)

```

- B.

```

alqueryLogicalExpression(
  operator: "AND",
  filters: {
    alqueryFilter(
      field: "caseType",
      operator: "=",
      value: "Accident"
    ),
    alqueryFilter(
      field: "insuranceType",
      operator: "=",
      value: "Health Insurance"
    )
  },
  logicalExpressions: alqueryLogicalExpression(
    operator: "OR",
    filters: alqueryFilter(
      field: "createdDate",
      value: today() - 10,
      operator: ">="
    )
  )
)

```

- C.

答案: B

解題說明:

A filter for createdDate >= today() - 10 (records created in the last 10 days).

A nested AND logical expression that requires both caseType = "Accident" and insuranceType = "Health Insurance".

問題 #29

Your client wants to configure user authentication using single sign-on (SSO) in their cloud environment. Which two authentication types should you use to support this requirement? (Choose two.)

- A. Appian authentication
- B. P1EE user authentication
- C. LDAP authentication
- D. OpenID Connect authentication

答案: A,D

解題說明:

OpenID Connect authentication supports single sign-on (SSO) by integrating with external identity providers.

Appian authentication can work in conjunction with SSO configurations as part of a hybrid setup or fallback mechanism.

問題 #30

You're configuring Health Check settings under the Admin Console.

Which section would you find the setting to indicate that the Health Check will run on a Production Environment?

- A. Automatic Upload
- B. General
- C. Scheduling

答案: A

解題說明:

The Automatic Upload section in the Health Check settings of the Admin Console includes the option to indicate that the Health Check is running on a Production Environment, which helps Appian appropriately analyze and benchmark the data.

問題 #31

You're creating a process to update specific fields in a list of records and you save the updated records to the database.

You're given the following performance considerations:

Execution time

Process instance memory usage

appian

vcesoft.com

Process execution engine load balancing

appian

vcesoft.com

Based on these performance metrics, rank the options from best to worst.

Note: To answer, move all steps from the Options list to the Answer List area and arrange them in the correct ranking order (best at the top, and worst at the bottom).

Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	
Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	
Within a script task, utilize an <code>forEach()</code> loop to update each record in the list.	
Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.	

答案:

解题说明:

Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Within a script task, utilize an <code>forEach()</code> loop to update each record in the list.
Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Within a script task, utilize an <code>forEach()</code> loop to update each record in the list.	Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.	Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.

Explanation:

Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Within a script task, utilize an <code>forEach()</code> loop to update each record in the list.
Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Within a script task, utilize an <code>forEach()</code> loop to update each record in the list.	Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.	Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.

問題 #32

Which two items are configured in the Admin Console when you create a web API? (Choose two.)

- A. Access Control Policies
- B. LDAP Authentication
- C. API Key
- D. Service Account

答案： C,D

解題說明：

API Keys are configured in the Admin Console to control and secure access to web APIs.

Service Accounts are managed in the Admin Console to allow external systems to authenticate and call the web APIs.
