Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q47-Q52):

NEW QUESTION # 47

What is a core pillar of the MuleSoft Catalyst delivery approach?

- A. Scope reduction
- B. Process thinking
- C. Technology centralization
- **D. Business outcomes**

Answer: D

Explanation:

MuleSoft Catalyst Pillars: The Catalyst methodology is built on three core pillars designed to drive successful digital transformation:

Business Outcomes: Defining clear KPIs and aligning technology with business goals⁶.

Technology Delivery: The actual implementation (Anypoint Platform).

Organizational Enablement: Building the C4E and training the team.

The Answer: "Business outcomes" is the only option listed that corresponds to one of these

NEW QUESTION # 48

What is an advantage of using OAuth 2.0 client credentials and access tokens over only API keys for API authentication?

- A. If the client ID is compromised, it can be exchanged for an API key
- **B. If the access token is compromised, the client credentials do not have to be reissued**
- C. If the client secret is compromised, the client credentials do not have to be reissued
- D. If the access token is compromised, it can be exchanged for an API key

Answer: B

Explanation:

Security Mechanisms:

API Keys (Client ID/Secret): These are static, long-lived credentials. If a Client Secret is stolen, you must reset it, update the application code, and redeploy-a painful process.

OAuth 2.0 (Access Tokens): The client uses the ID/Secret to request a temporary Access Token (TTL of usually 15-60 minutes).

The Advantage: The API client sends the token (not the secret) in the header. If this token is intercepted/compromised, it will expire shortly. The attacker cannot generate new tokens without the original Client Secret. Therefore, the underlying credentials remain safe, and you do not need to reissue them.

NEW QUESTION # 49

According to MuleSoft's recommended REST conventions, which HTTP method should an API use to specify how API clients can request data from a specified resource?

- A. PATCH
- B. POST
- C. PUT
- **D. GET**

Answer: D

Explanation:

HTTP GET: The GET method is used to retrieve (read) a representation of a resource⁴. It is safe and idempotent, meaning it does not alter the state of the server.

Usage: If you want to "request data" (e.g., Get Customer Details), GET is the standard method.

Why others are incorrect:

POST: Used to create a new resource.

PUT: Used to replace (update) an entire resource.

PATCH: Used to partially update a resource.

NEW QUESTION # 50

According to MuleSoft, which deployment characteristic applies to a microservices application architecture?

- **A. Services exist as independent deployment artifacts and can be scaled independently of other services**
- B. A deployment to enhance one capability requires a redeployment of all capabilities

- C. Core business capabilities are encapsulated in a single, deployable application
- D. All services of an application can be deployed together as single Java WAR file

Answer: A

Explanation:

Microservices Architecture: This approach structures an application as a collection of loosely coupled services¹⁰.

Independent Scalability: A defining characteristic is that each microservice is a separate deployment unit. If one service (e.g., "Order Processing") receives high load, you can scale only that service without having to scale the entire application¹¹.

Independent Deployment: You can update and redeploy a single microservice without impacting or redeploying the others.

Why others are incorrect:

Single Java WAR / Single deployable application (A, B): These describe a Monolithic architecture¹².

Redeployment of all (D): This is a major downside of Monoliths, not Microservices¹³.

NEW QUESTION # 51

A system administrator needs to determine when permissions were last changed for an Anypoint Platform user.

- A. Anypoint Monitoring
- **B. Audit Logging**
- C. Mule Stack Traces
- D. Anypoint Studio

Answer: B

Explanation:

Audit Logging: This feature in Anypoint Platform provides a searchable history of actions performed within the platform. It is designed specifically for governance and security compliance.

What it tracks: It records "who did what and when." This includes changes to:

User permissions and roles (Access Management).

Environment configurations.

API Manager policies.

Why others are incorrect:

Anypoint Monitoring: Focuses on application performance (CPU, Memory, API analytics), not administrative actions.

Stack Traces: Are used for debugging runtime application errors, not auditing user permissions.
