

The Best Latest Real Associate-Cloud-Engineer Exam Offers Candidates Perfect Actual Google Google Associate Cloud Engineer Exam Exam Products

BONUS!!! Download part of DumpsActual Associate-Cloud-Engineer dumps for free: <https://drive.google.com/open?id=1ebLR3HeulzRMtnodu8JKiM50NzsG3OfF>

In order to help all people to pass the Associate-Cloud-Engineer exam and get the related certification in a short time, we designed the three different versions of the Associate-Cloud-Engineer study materials. We can promise that the products can try to simulate the real examination for all people to learn and test at same time and it provide a good environment for learn shortcoming in study course. If you buy and use the Associate-Cloud-Engineer study materials from our company, you can complete the practice tests in a timed environment, receive grades and review test answers via video tutorials. You just need to download the software version of our Associate-Cloud-Engineer Study Materials after you buy our study materials. You will have the right to start to try to simulate the real examination. We believe that the Associate-Cloud-Engineer study materials from our company will not let you down.

The Google Associate-Cloud-Engineer exam covers a range of topics, including setting up a cloud solution environment, deploying and implementing cloud solutions, configuring access and security, monitoring and logging cloud operations, and managing cloud resources. It is a comprehensive exam that requires a strong understanding of Google Cloud technologies and their applications.

Google Associate-Cloud-Engineer Certification Exam is designed to test your knowledge and skills in managing and deploying Google Cloud Platform (GCP) solutions. Associate-Cloud-Engineer exam covers a wide range of topics, including setting up a cloud solution environment, managing storage and compute resources, configuring and deploying applications, and monitoring and managing operations.

Google Associate-Cloud-Engineer Questions - Perfect Exam Preparation [2026]

DumpsActual always provides customer support for the convenience of desktop Google Associate-Cloud-Engineer practice test software users. The Google Associate-Cloud-Engineer certification provides both novices and experts with a fantastic opportunity to show off their knowledge of and proficiency in carrying out a particular task. You can benefit from a number of additional benefits after completing the Google Associate-Cloud-Engineer Certification Exam.

Google Associate Cloud Engineer Certification Exam is a professional certification offered by Google Cloud for individuals interested in becoming an Associate Cloud Engineer. Google Associate Cloud Engineer Exam certification is designed to validate your skills and knowledge in managing and deploying applications, monitoring operations, and configuring cloud solutions on Google

Google Associate Cloud Engineer Exam Sample Questions (Q74-Q79):

NEW QUESTION # 74

You are hosting an application on bare-metal servers in your own data center. The application needs access to Cloud Storage. However, security policies prevent the servers hosting the application from having public IP addresses or access to the internet. You want to follow Google-recommended practices to provide the application with access to Cloud Storage. What should you do?

- A. 1. Using Cloud VPN or Interconnect, create a tunnel to a VPC in GCP.2. Use Cloud Router to create a custom route advertisement for 199.36.153.4/30. Announce that network to your on-premises network through the VPN tunnel.3. In your on-premises network, configure your DNS server to resolve *.googleapis.com as a CNAME to restricted.googleapis.com.
- B. 1. Using Cloud VPN, create a VPN tunnel to a Virtual Private Cloud (VPC) in Google Cloud Platform (GCP).2. In this VPC, create a Compute Engine instance and install the Squid proxy server on this instance.3. Configure your servers to use that instance as a proxy to access Cloud Storage.
- C. 1. Use Migrate for Compute Engine (formerly known as Velostrata) to migrate those servers to Compute Engine.2. Create an internal load balancer (ILB) that uses storage.googleapis.com as backend.3. Configure your new instances to use this ILB as proxy.
- D. 1. Use nslookup to get the IP address for storage.googleapis.com.2. Negotiate with the security team to be able to give a public IP address to the servers.3. Only allow egress traffic from those servers to the IP addresses for storage.googleapis.com.

Answer: A

NEW QUESTION # 75

You are using Data Studio to visualize a table from your data warehouse that is built on top of BigQuery. Data is appended to the data warehouse during the day. At night, the daily summary is recalculated by overwriting the table. You just noticed that the charts in Data Studio are broken, and you want to analyze the problem. What should you do?

- A. Review the Error Reporting page in the Cloud Console to find any errors.
- B. In Cloud Logging create a filter for your Data Studio report
- C. Use Cloud Debugger to find out why the data was not refreshed correctly
- D. Use the BigQuery interface to review the nightly Job and look for any errors

Answer: C

Explanation:

Cloud Debugger helps inspect the state of an application, at any code location, without stopping or slowing down the running app // <https://cloud.google.com/debugger/docs>

NEW QUESTION # 76

You have deployed an application on a Compute Engine instance. An external consultant needs to access the Linux-based instance. The consultant is connected to your corporate network through a VPN connection, but the consultant has no Google account. What should you do?

- A. Instruct the external consultant to use the gcloud compute ssh command line tool by using Identity-Aware Proxy to access the instance.
- B. Instruct the external consultant to generate an SSH key pair, and request the public key from the consultant. Add the public key to the instance yourself, and have the consultant access the instance through SSH with their private key.
- C. Instruct the external consultant to use the gcloud compute ssh command line tool by using the public IP address of the instance to access it.
- D. Instruct the external consultant to generate an SSH key pair, and request the private key from the consultant. Add the private key to the instance yourself, and have the consultant access the instance through SSH with their public key.

Answer: B

Explanation:

The best option is to instruct the external consultant to generate an SSH key pair, and request the public key from the consultant. Then, add the public key to the instance yourself, and have the consultant access the instance through SSH with their private key.

This way, you can grant the consultant access to the instance without requiring a Google account or exposing the instance's public IP address. This option also follows the best practice of using user-managed SSH keys instead of service account keys for SSH access¹.

Option A is not feasible because the external consultant does not have a Google account, and therefore cannot use Identity-Aware Proxy (IAP) to access the instance. IAP requires the user to authenticate with a Google account and have the appropriate IAM permissions to access the instance². Option B is not secure because it exposes the instance's public IP address, which can increase the risk of unauthorized access or attacks. Option D is not correct because it reverses the roles of the public and private keys. The public key should be added to the instance, and the private key should be kept by the consultant. Sharing the private key with anyone else can compromise the security of the SSH connection³.

NEW QUESTION # 77

You are deploying a production application on Compute Engine. You want to prevent anyone from accidentally destroying the instance by clicking the wrong button. What should you do?

- A. Enable delete protection on the instance.
- B. Disable the flag "Delete boot disk when instance is deleted."
- C. Enable Preemptibility on the instance.
- D. Disable Automatic restart on the instance.

Answer: A

Explanation:

Preventing Accidental VM Deletion This document describes how to protect specific VM instances from deletion by setting the deletionProtection property on an Instance resource. To learn more about VM instances, read the Instances documentation. As part of your workload, there might be certain VM instances that are critical to running your application or services, such as an instance running a SQL server, a server used as a license manager, and so on. These VM instances might need to stay running indefinitely so you need a way to protect these VMs from being deleted. By setting the deletionProtection flag, a VM instance can be protected from accidental deletion. If a user attempts to delete a VM instance for which you have set the deletionProtection flag, the request fails. Only a user that has been granted a role with compute.instances.create permission can reset the flag to allow the resource to be deleted. <https://cloud.google.com/compute/docs/instances/preventing-accidental-vm-deletion>

NEW QUESTION # 78

You have a single binary application that you want to run on Google Cloud Platform. You decided to automatically scale the application based on underlying infrastructure CPU usage. Your organizational policies require you to use virtual machines directly. You need to ensure that the application scaling is operationally efficient and completed as quickly as possible. What should you do?

- A. Create an instance template, and use the template in a managed instance group that scales up and down based on the time of day.
- B. Create a Google Kubernetes Engine cluster, and use horizontal pod autoscaling to scale the application.
- C. Use a set of third-party tools to build automation around scaling the application up and down, based on Stackdriver CPU usage monitoring.
- D. Create an instance template, and use the template in a managed instance group with autoscaling configured.

Answer: D

Explanation:

Managed instance groups offer autoscaling capabilities that let you automatically add or delete instances from a managed instance group based on increases or decreases in load (CPU Utilization in this case). Autoscaling helps your apps gracefully handle increases in traffic and reduce costs when the need for resources is lower.

You define the autoscaling policy and the autoscaler performs automatic scaling based on the measured load (CPU Utilization in this case). Autoscaling works by adding more instances to your instance group when there is more load (upscaling), and deleting instances when the need for instances is lowered (downscaling).
