**Answer: C**

Explanation:

Explanation

To enable VMAC mode on a cluster member, you need to set the value of the global kernel parameter fwha\_vmac\_global\_param\_enabled to 1. This can be done on-the-fly using the command fw ctl set int fwha\_vmac\_global\_param\_enabled 1 on all cluster members. This command does not require a reboot or a policy installation. VMAC mode allows the cluster to use a virtual MAC address for its virtual IP addresses, which reduces the number of gratuitous ARP packets sent upon failover and avoids ARP cache issues on some routers and switches.
