

# CCCS-203b Materials - New CCCS-203b Test Answers

BTW, DOWNLOAD part of PrepPDF CCCS-203b dumps from Cloud Storage: <https://drive.google.com/open?id=18kdMG7hG21-t30FKaGBNyWJm5Ws0usS>

No doubt the CrowdStrike CCCS-203b certification is a valuable credential that offers countless advantages to CCCS-203b exam holders. Beginners and experienced professionals can validate their skills and knowledge level with the CrowdStrike Certified Cloud Specialist CCCS-203b Exam and earn solid proof of their proven skills.

## CrowdStrike CCCS-203b Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Falcon Cloud Security Features and Services: This domain covers understanding CrowdStrike's cloud security products (CSPM, CWP, ASPM, DSPM, IaC security) and their integration, plus one-click sensor deployment and Kubernetes admission controller capabilities.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• Remediating and Reporting Issues: This domain addresses identifying remediation steps for findings, using scheduled reports for cloud security, and utilizing Falcon Fusion SOAR workflows for automated notifications.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>• Cloud Security Policies and Rules: This domain addresses configuring CSPM policies, image assessment policies, Kubernetes admission controller policies, and runtime sensor policies based on specific use cases.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>• Runtime Protection: This domain focuses on selecting appropriate Falcon sensors for Kubernetes environments, troubleshooting deployments, and identifying misconfigurations, unassessed images, IOAs, rogue containers, drift, and network connections.</li></ul>

Topic 5	<ul style="list-style-type: none"> <li>• Pre-Runtime Protection: This domain covers managing registry connections, selecting image assessment methods, and analyzing assessment reports to identify malware, CVEs, leaked secrets, Dockerfile misconfigurations, and vulnerabilities before deployment.</li> </ul>
Topic 6	<ul style="list-style-type: none"> <li>• Findings and Detection Analysis: This domain covers evaluating security controls to identify IOMs, vulnerabilities, suspicious activity, and persistence mechanisms, auditing user permissions, comparing configurations to benchmarks, and discovering unmanaged public-facing assets.</li> </ul>

## Pass Guaranteed Quiz 2026 High Pass-Rate CCCS-203b: CrowdStrike Certified Cloud Specialist Materials

In cyber age, it's essential to pass the CCCS-203b exam to prove ability especially for lots of office workers. Our company, with a history of ten years, has been committed to making efforts on developing CCCS-203b exam guides in this field. Since the establishment, we have won wonderful feedback from customers and ceaseless business and continuously worked on developing our CCCS-203b Exam prepare to make it more received by the public. Moreover, our understanding of the importance of information technology has reached a new level. Efforts have been made in our experts to help our candidates successfully pass CCCS-203b exam. Seldom dose the e-market have an authorized study materials for reference.

### CrowdStrike Certified Cloud Specialist Sample Questions (Q105-Q110):

#### NEW QUESTION # 105

You are using CrowdStrike's Cloud Infrastructure Entitlement Manager (CIEM) to manage access policies in your organization. You want to assign a policy that restricts access to a specific cloud storage service only to users in the "Finance" group. What steps must you take to ensure this policy is correctly assigned and enforced?

- A. Use CIEM to deactivate all policies for other groups, leaving only the "Finance" group with permissions.
- B. Configure the policy in the cloud provider's IAM service and then synchronize it with CIEM.
- C. Define a policy in CIEM targeting the "Finance" group and map it to the relevant roles and permissions for the cloud storage service.
- D. Assign the policy at the cloud provider level and ensure it applies to all roles, overriding specific user permissions.

**Answer: C**

Explanation:

Option A: Configuring policies directly in the cloud provider's IAM service bypasses CIEM's centralized management capabilities, reducing visibility and control over entitlements.

Synchronization with CIEM is typically used for monitoring, not primary configuration.

Option B: Deactivating all other policies is not a scalable or secure approach. It can inadvertently disrupt other users' workflows and does not utilize CIEM's ability to manage entitlements effectively.

Option C: CIEM enables you to define and assign policies targeting specific groups, such as "Finance," and map them to roles and permissions for services like cloud storage. This approach ensures policies are aligned with organizational requirements and avoids over-provisioning.

Option D: While assigning policies at the cloud provider level is possible, it is not the recommended approach when using CIEM. CIEM provides granular control, allowing you to manage permissions based on groups or roles rather than applying blanket policies.

#### NEW QUESTION # 106

An organization has deployed CrowdStrike Falcon on their cloud workloads, but they notice that real-time detection and blocking are not functioning as expected. Upon reviewing the deployment, they identify a configuration oversight.

Which of the following is the most likely reason that runtime protection is not working?

- A. The Falcon sensor logs indicate no active threats were detected, meaning the deployment is successful.
- B. The cloud workload protection policies are configured to monitor but not block threats.
- C. The container runtime is using an unsupported version of Docker.
- D. The Falcon Container Sensor was installed without enabling workload protection policies.

**Answer: D**

Explanation:

Option A: While some older versions of Docker may have compatibility issues, most modern Docker versions are supported by CrowdStrike Falcon. The issue is more likely a misconfiguration than a compatibility problem.

Option B: While a "monitor-only" policy can prevent blocking, it does not explain why real-time detection is not functioning. The absence of protection is likely due to a broader misconfiguration.

Option C: Even if the Falcon Sensor is installed correctly, runtime protection requires active security policies. If these policies are missing or misconfigured, the sensor will not enforce security actions, leading to ineffective threat prevention.

Option D: The absence of detected threats does not confirm that protection is working. It is possible that policies are misconfigured, and malicious activity is going unnoticed.

#### **NEW QUESTION # 107**

What is the best practice when configuring an assessment schedule in CrowdStrike's Cloud Security Posture Management (CSPM) module?

- **A. Configure assessments at a frequency that aligns with compliance or business requirements.**
- B. Run assessments only during off-peak hours to avoid performance degradation in cloud resources.
- C. Use default settings without reviewing scope and frequency, as they are pre-optimized by CrowdStrike.
- D. Schedule assessments for each cloud account individually to avoid overlaps.

**Answer: A**

Explanation:

Option A: Default settings may not always align with an organization's specific compliance needs or operational cadence. Reviewing and customizing scope and frequency ensures the assessments are optimized for the specific environment.

Option B: Aligning assessment frequency with compliance or business requirements is the best practice. For example, compliance frameworks like SOC 2 or ISO 27001 may mandate daily or weekly assessments, while more frequent scans may be needed in dynamic environments.

Option C: Scheduling assessments individually for each cloud account can be unnecessarily complex and prone to errors. CrowdStrike allows centralized scheduling for multiple accounts, simplifying management and ensuring comprehensive coverage.

Option D: While off-peak scheduling may reduce resource contention in certain cases, CSPM assessments are non-intrusive and should prioritize security and compliance needs over resource availability. Waiting for off-peak hours may delay detection of vulnerabilities.

#### **NEW QUESTION # 108**

After deploying the CrowdStrike Container Sensor on your Kubernetes cluster, you notice that it is only monitoring a subset of your containers.

Which of the following is the most likely cause of this issue?

- A. Network policies within the Kubernetes cluster are blocking outbound traffic from the sensor.
- B. The containers were created using privileged mode.
- C. The CrowdStrike Falcon Console account does not have the appropriate role permissions to view all containers.
- **D. The CrowdStrike Container Sensor pod is not running on every node in the cluster.**

**Answer: D**

Explanation:

Option A: The CrowdStrike Container Sensor is designed to monitor both privileged and unprivileged containers. Privileged mode is not a factor that would prevent the sensor from monitoring containers.

Option B: For the CrowdStrike Container Sensor to monitor all containers, it must be deployed on every node in the Kubernetes cluster where containers are running. This ensures that the sensor can collect data from all workloads on those nodes. If the sensor pod is not deployed on certain nodes, containers on those nodes will not be monitored.

Option C: Network policies might prevent telemetry data from reaching the CrowdStrike Falcon Console, but this would result in missing data for all containers, not just a subset.

Option D: Permissions in the Falcon Console govern what data can be viewed, but they do not impact what the sensor itself monitors.

### NEW QUESTION # 109

What is the most appropriate first step when creating a Falcon Fusion workflow to notify individuals about automated remediation actions?

- A. Manually send an email notification to the security team.
- **B. Set up a trigger event for the workflow, such as a detection in the Falcon platform.**
- C. Create a custom dashboard to visualize all remediation events.
- D. Add a conditional step to verify if the action is approved by an administrator.

**Answer: B**

Explanation:

Option A: The first step in creating a Falcon Fusion workflow is to define the trigger event that initiates the workflow. This could be a specific detection type or another event in the Falcon platform. Without a trigger, the workflow has no starting point. This step ensures that the workflow activates only in response to the desired conditions.

Option B: While notifying the security team is important, manually sending emails defeats the purpose of automating workflows with Falcon Fusion. Automation is designed to streamline the response process and reduce human intervention.

Option C: Adding conditional steps for approval might be part of the workflow, but it is not the first step. Conditional logic is applied after the workflow is triggered. Focusing on triggers first is essential.

Option D: While dashboards are useful for monitoring, they are not part of creating workflows.

Dashboards visualize outcomes, whereas workflows focus on defining triggers and actions.

### NEW QUESTION # 110

.....

If you are worried about your CCCS-203b practice test and you have no much time to prepare, now you can completely rest assured it because we will offer you the most updated CCCS-203b dumps pdf with 100% correct answers. You can save your time and money by enjoying one-year free update after purchasing our CCCS-203b Dumps PDF. We also provide the free demo for your reference.
