You can alter the duration and quantity of Cisco 200-901 Questions in these 200-901 practice exams

as per your training needs.

Cisco DevNet Associate Exam Sample Questions (Q392-Q397):

NEW QUESTION # 392
How does requesting a synchronous API operation differ from requesting an asynchronous API operation?

- A. clients subscribe to a webhook for operation results
- B. clients poll for the status of the execution of operations
- C. clients can access the results immediately
- D. clients receive responses with a task id for further processing

Answer: C

Explanation:
Synchronous API Operations:
Immediate Response: In a synchronous operation, the client sends a request to the server and waits for an immediate response. The client cannot proceed until it receives this response.
Blocking Call: The call is considered blocking, meaning the client application is blocked from performing other tasks until the response is received.
Use Case: This is useful when the result of the operation is required immediately to continue the workflow.
Asynchronous API Operations:
Delayed Response: In an asynchronous operation, the client sends a request to the server and does not wait for an immediate response. Instead, it continues its processing and can check back later for the result.
Non-blocking Call: The call is non-blocking, allowing the client to perform other tasks while waiting for the server to complete the operation.
Polling and Webhooks: Clients may poll the server for status updates or subscribe to a webhook to be notified when the operation is complete.
Task ID: The server may provide a task ID in the response that can be used to check the status of the operation later.

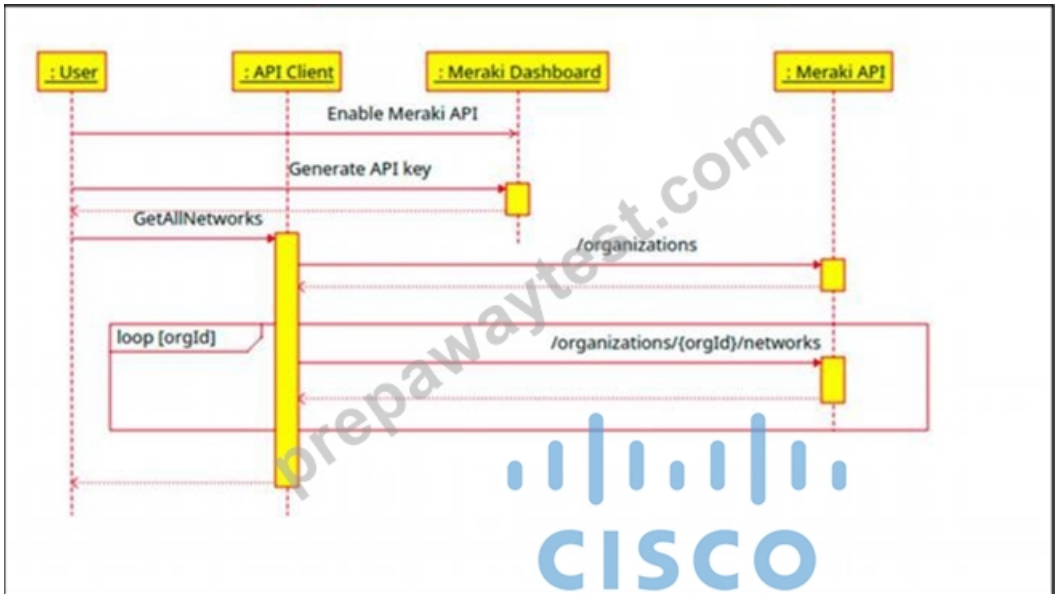
NEW QUESTION # 393
Refer to the exhibit.

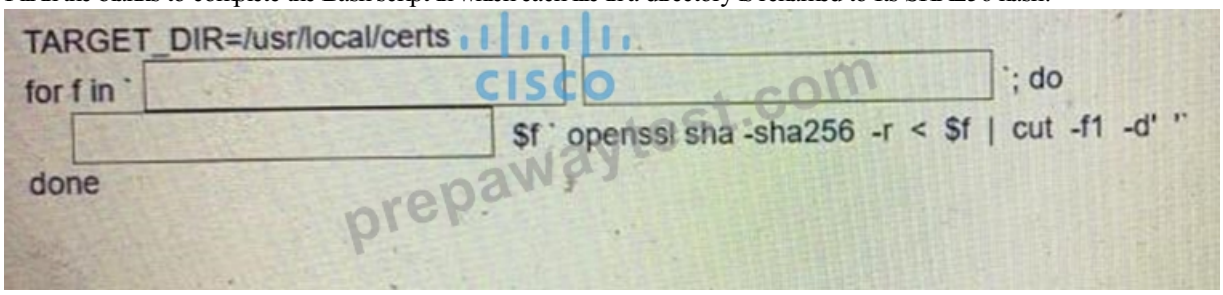


The Cisco Meraki API manages two organizations. In each organization, two independent networks are defined. How many calls to the /organizations/(orgid)networks endpoint will be run parallel by the GetAllNetwork function of the API client?

- A. 0
- B. 1
- C. 2
- D. 3

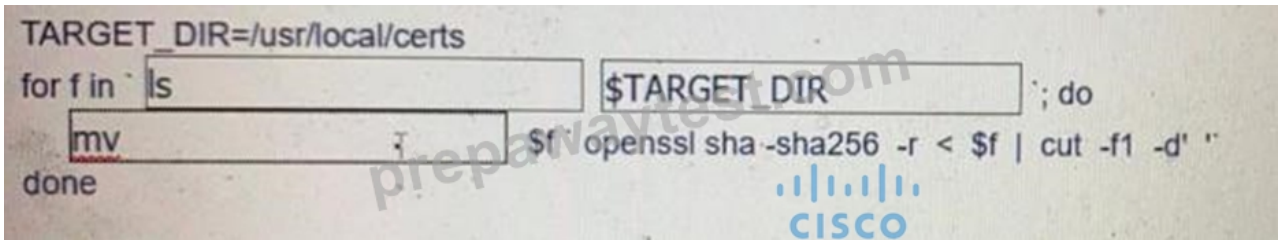
Answer: C

NEW QUESTION # 394
Fill in the blanks to complete the Bash script in which each file in a directory is renamed to Its SHA256 hash?



Answer:

Explanation:
Check below the answer exact.



NEW QUESTION # 395
Refer to the exhibit.

```
- hosts: nxos_rtr
  gather_facts: false
  tasks:
  - nxos_hsrp:
      group: "{{ item.group }}"
      vip: "{{ item.vip }}"
      priority: 115
      interface: "{{ item.interface }}"
      preempt: enabled
      auth_type: md5
      auth_string: "s3cuR3"
      version: 2
      host: "{{ hostvars['rtr-1a']['ansible_ssh_host'] }}"
    with_items:
      - "{{ hsrp_groups }}"
    delegate_to: "{{ hostvars['srv-1a']['ansible_ssh_host'] }}"
```

An engineer runs a network that consists of Cisco Nexus devices. The network is distributed between data centers in different locations. The switches are configured using standalone connections and a single point of failure. Which process is being automated by the Ansible playbook?

- A. executing HSRP configuration from the Ansible controller node
- B. enabling HSRP on the rtr-1a inventory host
- C. enabling HSRP on the nxos_rtr inventory host
- D. executing HSRP configuration from the srv-1a inventory host

Answer: C

Explanation:
The Ansible playbook in the exhibit is designed to automate the configuration of HSRP (Hot Standby Router Protocol) on a Cisco Nexus switch listed in the nxos_rtr inventory group. Here's what the playbook does:
Hosts: The playbook is targeting nxos_rtr hosts.
Task: The task uses the nxos_hsrp module to configure HSRP.
Parameters: Various parameters such as group, VIP, priority, interface, authentication, and version are set for HSRP configuration.
Delegation: The configuration is delegated to the srv-1a inventory host, but it is still targeting the nxos_rtr for the actual HSRP configuration.

Therefore, the playbook is enabling HSRP on the nxos_rtr inventory host.
