

AB-Abdomen Valid Practice Materials & AB-Abdomen New Guide Files

DOWNLOAD the newest DumpsQuestion AB-Abdomen PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1rvhVtH9k6sytWkeMhvV1uaTzZM84pP58>

It is our company that can provide you with special and individual service which includes our AB-Abdomen preparation quiz and good after-sale services. Our experts will check whether there is an update every day, so you needn't worry about the accuracy of AB-Abdomen Study Materials. If there is an update system, we will send them to the customer automatically. As is known to all, our AB-Abdomen simulating materials are high pass-rate in this field, that's why we are so famous.

The prominent benefits of Abdomen Sonography Examination certification exam are validation of skills, updated knowledge, more career opportunities, instant rise in salary, and advancement of the career. Obviously, every serious professional wants to gain all these advantages. With the ARDMS AB-Abdomen Certification Exam, you can achieve this goal nicely and quickly.

AB-Abdomen New Guide Files | AB-Abdomen Reliable Exam Registration

As we all know, review what we have learned is important, since, it can make us have a good command of the knowledge. AB-Abdomen Online test engine has testing history and performance review, and you can have general review of what you have learned. In addition, with the professional team to edit, AB-Abdomen exam cram is high-quality, and it also contain certain quantity, and you

can pass the exam by using AB-Abdomen Exam Dumps. In order to serve you better, we have online and offline chat service, and if you have any questions for AB-Abdomen exam materials, you can consult us, and we will give you reply as soon as possible.

ARDMS Abdomen Sonography Examination Sample Questions (Q11-Q16):

NEW QUESTION # 11

Which sonographic finding is commonly associated with transitional cell cancer of urinary bladder?

- A. Flat sessile lesion
- **B. Polypoidal non-mobile focal mass**
- C. Ulcerated solid infiltrative lesion
- D. Diffuse wall thickening

Answer: B

Explanation:

Transitional cell carcinoma (TCC) typically presents as a non-mobile, polypoidal, focal intraluminal mass projecting from the bladder wall. Mobility of the lesion helps differentiate TCC from blood clots or debris.

According to Rumack's Diagnostic Ultrasound:

"Bladder TCC most often appears as a non-mobile, polypoid mass attached to the bladder wall." Reference:

Rumack CM, Wilson SR, Charboneau JW, Levine D. Diagnostic Ultrasound. 5th ed. Elsevier, 2017.

AIUM Practice Parameter for Bladder Ultrasound, 2020.

-

NEW QUESTION # 12

Which condition is demonstrated in this image?

- **A. Cavernous transformation**
- B. Portal vein thrombosis
- C. Portal hypertension
- D. Tumor extension

Answer: A

Explanation:

The image shows a color Doppler ultrasound of the main portal vein (MPV), which appears irregular and replaced by multiple small, serpiginous vascular channels - a hallmark of cavernous transformation.

Cavernous transformation of the portal vein is a late complication of chronic portal vein thrombosis, in which collateral vessels develop around the thrombosed portal vein to bypass the obstruction.

Key Doppler ultrasound features of cavernous transformation:

- * Absence of a normal portal vein
- * Multiple tortuous vessels in the porta hepatis
- * Color Doppler shows hepatopetal flow in these channels
- * Low velocity, continuous waveform flow in collateral vessels

Differentiation from other options:

- * B. Portal vein thrombosis: Would show an absence of color flow within the portal vein lumen and possibly echogenic material within the vessel. There would be no serpiginous collateral vessels yet if it's an acute process.
- * C. Portal hypertension: Often diagnosed with other sonographic findings (e.g., splenomegaly, reversed portal flow, varices) but not characterized by the replacement of the portal vein by collateral vessels.
- * D. Tumor extension: Typically appears as echogenic intraluminal material within the portal vein with arterial waveforms on Doppler due to neovascularity. Tumor thrombus can be seen in hepatocellular carcinoma or pancreatic cancer, not multiple small collateral vessels.

NEW QUESTION # 13

Which malignancy most commonly metastasizes to the testes?

- A. Hodgkin lymphoma
- **B. Prostate cancer**
- C. Non-Hodgkin lymphoma
- D. Bladder cancer

Answer: B

Explanation:

Testicular metastases are rare and usually identified in older patients. The most frequent primary site of malignancies metastasizing to the testes is the prostate. Studies (Ulbright and Young, 2008; Mosharafa et al., 2003) indicate that prostatic adenocarcinoma accounts for the highest number of testicular metastases, with lung and gastrointestinal tract malignancies also contributing less frequently. These metastases can be unilateral or bilateral and are often discovered incidentally during surgical intervention for prostate cancer.

The metastatic route involves retrograde venous extension, arterial embolism, or lymphatic dissemination.

Histologically, prostatic adenocarcinoma in the testis can be confirmed via immunohistochemical markers like prostate-specific antigen (PSA), supporting its prostatic origin.

NEW QUESTION # 14

Which renal finding is often present in patients with tuberous sclerosis?

- A. Renal cell carcinoma
- B. Multilocular cystic nephroma
- C. Sinus lipomatosis
- **D. Angiomyolipoma**

Answer: D

Explanation:

Angiomyolipomas are benign renal tumors composed of fat, smooth muscle, and blood vessels. They are strongly associated with tuberous sclerosis and may be multiple and bilateral in these patients. While RCC may occur, angiomyolipomas are much more characteristic.

According to Rumack's Diagnostic Ultrasound:

"Angiomyolipomas are frequently multiple and bilateral in patients with tuberous sclerosis." Reference: Rumack CM, Wilson SR, Charboneau JW, Levine D. Diagnostic Ultrasound. 5th ed. Elsevier, 2017. AIUM Practice Parameter for Renal Ultrasound, 2020.

-

NEW QUESTION # 15

A patient with hepatocellular carcinoma presents for a paracentesis. Which lab value is the most pertinent to the procedure?

- A. Total bilirubin
- B. Alanine aminotransferase
- C. Alpha fetoprotein
- D. International normalized ratio

Answer: D

Explanation:

Before performing a paracentesis, assessment of the patient's coagulation status is crucial to minimize bleeding risk. The International Normalized Ratio (INR) is the standard lab value used to assess coagulation.

Elevated INR may increase the risk of bleeding complications during the procedure. ALT, AFP, and bilirubin levels evaluate liver function or cancer progression but are not directly relevant to bleeding risk for this procedure.

As per AASLD and SIR guidelines:

"An INR and platelet count should be evaluated before paracentesis to assess bleeding risk. Minor elevations in INR (<1.5) may not contraindicate the procedure." (AASLD Practice Guidance, 2021; SIR Consensus Guidelines, 2019).

Reference:

American Association for the Study of Liver Diseases (AASLD), Management of Ascites, 2021.

Society of Interventional Radiology (SIR) Consensus Guidelines for Coagulation Parameters in Image- Guided Procedures, 2019.

NEW QUESTION # 16

.....

Therefore, if you have struggled for months to pass Abdomen Sonography Examination AB-Abdomen exam, be rest assured you will pass this time with the help of our Abdomen Sonography Examination AB-Abdomen exam dumps. Every Abdomen Sonography Examination AB-Abdomen candidate who has used our exam preparation material has passed the exam with flying colors. Availability in different formats is one of the advantages valued by Abdomen Sonography Examination exam candidates. It allows them to choose the format of Abdomen Sonography Examination AB-Abdomen Dumps they want.
