

# Valid JN0-683 Test Notes | Vce JN0-683 Test Simulator

What's more, part of that ExamPrepAway JN0-683 dumps now are free: [https://drive.google.com/open?id=1PZ8XuVzu\\_rWa23o4hMFuIKU6RpMUq6K](https://drive.google.com/open?id=1PZ8XuVzu_rWa23o4hMFuIKU6RpMUq6K)

Passing the Data Center, Professional (JNCIP-DC) JN0-683 exam is your best career opportunity. The rich experience with relevant certificates is important for enterprises to open up a series of professional vacancies for your choices. Juniper JN0-683 learning quiz bank and learning materials look up the latest questions and answers based on the topics you choose. This choice will serve as a breakthrough of your entire career, so prepared to be amazed by high quality and accuracy rate of our JN0-683 Study Guide.

## Juniper JN0-683 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Data Center Multitenancy and Security: This section tests knowledge of single-tenant and multitenant data center setups. Candidates such as Data Center Professionals are evaluated on ensuring tenant traffic isolation at both Layer 2 and Layer 3 levels in shared infrastructure environments.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• Layer 3 Fabrics: This section measures the knowledge of professionals managing IP-based networks in data centers. It covers IP fabric architecture and routing, ensuring candidates understand how the network is structured for scalability and how traffic is routed efficiently.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>• Data Center Interconnect: For Data Center Engineers, this part focuses on interconnecting data centers, covering Layer 2 and Layer 3 stretching, stitching fabrics together, and using EVPN-signaled VXLAN for seamless communication between data centers.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>• Data Center Deployment and Management: This section assesses the expertise of data center networking professionals like architects and engineers, focusing on key deployment concepts. Topics include Zero-touch provisioning (ZTP), which automates device setup in data centers without manual input.</li></ul>
Topic 5	<ul style="list-style-type: none"><li>• VXLAN: This part requires knowledge of VXLAN, particularly how the control plane manages communication between devices, while the data plane handles traffic flow. Demonstrate knowledge of how to configure, Monitor, or Troubleshoot VXLAN.</li></ul>

## Vce JN0-683 Test Simulator | JN0-683 Hottest Certification

It helps you to pass the Juniper JN0-683 test with excellent results. Juniper JN0-683 imitates the actual JN0-683 exam environment. You can take the JN0-683 practice exam many times to evaluate and enhance your Juniper JN0-683 Exam Preparation level. Desktop JN0-683 practice test software is compatible with windows and the web-based software will work on these operating systems: Android, IOS, Windows, and Linux.

## Juniper Data Center, Professional (JNCIP-DC) Sample Questions (Q23-Q28):

### NEW QUESTION # 23

You are asked to deploy 100 QFX Series devices using ZTP. Each QFX5120 requires a different configuration. In this scenario, what are two components that you would configure on the DHCP server?  
(Choose two.)

- A. the IP address of the FTP server
- B. the MAC address for each QFX5120
- C. the management IP address for each QFX5120
- D. the MAC address of the FTP server

**Answer: B,C**

Explanation:

\* Zero Touch Provisioning (ZTP):

\* ZTP allows for the automated configuration of network devices, like QFX Series switches, without manual intervention. During ZTP, a switch will obtain its configuration from a DHCP server and then download the required software and configuration files from a specified server (e.

g., FTP, HTTP).

\* DHCP Server Configuration:

\* Option B: The DHCP server needs to know the MAC address for each QFX5120 to provide a specific configuration based on the device identity. By mapping the MAC address to a particular configuration, the DHCP server can ensure that each switch gets the correct configuration.

\* Option D: The management IP address for each QFX5120 must also be assigned by the DHCP server. This IP address allows the device to communicate on the network and access the configuration files and other required resources during the ZTP process.

Conclusion:

\* Option B: Correct MAC addresses allow the DHCP server to identify each QFX5120 and assign the appropriate configuration.

\* Option D: Correct Management IP addresses are essential for network communication during ZTP.

### NEW QUESTION # 24

You are asked for TX and RX traffic statistics for each interface to which an application server is attached. The statistics need to be reported every five seconds. Using the Junos default settings, which telemetry method would accomplish this request?

- A. Native Sensors
- B. gNMI
- C. OpenConfig
- D. SNMP

**Answer: A**

Explanation:

Native Sensors: Junos provides "Native Sensors" as part of its telemetry capabilities, which can be used to gather interface statistics like TX (transmit) and RX (receive) traffic. With the default configuration, native sensors can be configured to report traffic statistics at a specified interval, such as every five seconds, making this the correct method to fulfill the requirement for periodic traffic reporting.

### NEW QUESTION # 25

You are deploying a new network to support your AI workloads on devices that support at least 400 Gbps Ethernet. There is no requirement for any Layer 2 VLANs in this network. Which network architecture would satisfy this requirement?

- A. an IP fabric using the EVPN-MPLS architecture
- B. an IP fabric using PIM-SM to signal VXLAN overlay
- **C. an IP fabric using EBGP**
- D. an IP fabric with an EVPN-VXLAN architecture

**Answer: C**

Explanation:

\* Requirements for AI Workloads:

\* The scenario requires a network that supports at least 400 Gbps Ethernet and does not require Layer 2 VLANs. This setup is well-suited for a pure Layer 3 network, which can efficiently route traffic between devices without the overhead or complexity of maintaining Layer 2 domains.

\* Choosing the Right Network Architecture:

\* Option D: An IP fabric using EBGP (External BGP) is ideal for this scenario. In a typical IP fabric, EBGP is used to handle routing between spine and leaf switches, creating a scalable and efficient network. Since there is no need for Layer 2 VLANs, the pure IP fabric design with EBGP provides a straightforward and effective solution.

\* Options A, B, and C involve more complex architectures (like VXLAN or EVPN), which are unnecessary when there's no requirement for Layer 2 overlays or VLANs.

Conclusion:

\* Option D: Correct - An IP fabric with EBGP is the most suitable and straightforward architecture for a network that needs to support high-speed AI workloads without Layer 2 VLANs.

**NEW QUESTION # 26**

Exhibit:

Referring to the exhibit, which statement is true?

- A. A PBB-EVPN architecture is being used.
- **B. An ERB architecture is being used.**
- C. A CRB architecture is being used.
- D. An OTT architecture is being used.

**Answer: B**

Explanation:

\* Understanding Network Architectures:

\* ERB (Edge Routed Bridging) architecture involves routing at the network's edge (leaf nodes), while traffic between leaf nodes is switched. This is commonly used in VXLAN-EVPN setups.

\* Analysis of the Exhibit:

\* The exhibit shows configurations related to routing instances, VXLAN, and VLANs, with VNIs being used for each VLAN. This setup is characteristic of an ERB architecture where each leaf device handles Layer 3 routing for its connected devices.

Conclusion:

\* Option B: Correct - The configuration shown corresponds to an ERB architecture where routing occurs at the network's edge (leaf devices).

**NEW QUESTION # 27**

You are asked to set up an IP fabric that supports AI or ML workloads. You have chosen to use lossless Ethernet in this scenario, which statement is correct about congestion management?

- A. The switch experiencing the congestion notifies the source device.
- B. Only the source and destination devices need ECN enabled.
- C. ECN is negotiated only among the switches that make up the IP fabric for each queue.
- **D. ECN marks packets based on WRED settings.**

**Answer: D**

Explanation:

Step 1: Understand the Context of Lossless Ethernet and Congestion Management

\* Lossless Ethernet in IP Fabrics: AI/ML workloads often require high throughput and low latency, with minimal packet loss.

Lossless Ethernet is achieved using mechanisms like Priority Flow Control (PFC), which pauses traffic on specific priority queues to

prevent drops during congestion. This is common in data center IP fabrics supporting RoCE (RDMA over Converged Ethernet), a protocol often used for AI/ML workloads.

\* Congestion Management: In a lossless Ethernet environment, congestion management ensures that the network can handle bursts of traffic without dropping packets. Two key mechanisms are relevant here:

\* Priority Flow Control (PFC): Pauses traffic on a specific queue to prevent buffer overflow.

\* Explicit Congestion Notification (ECN): Marks packets to signal congestion, allowing end devices to adjust their transmission rates (e.g., by reducing the rate of RDMA traffic).

\* AI/ML Workloads: These workloads often use RDMA (e.g., RoCEv2), which relies on ECN to manage congestion and PFC to ensure no packet loss. ECN is critical for notifying the source device of congestion so it can throttle its transmission rate.

Step 2: Evaluate Each Statement

A: The switch experiencing the congestion notifies the source device.

\* In a lossless Ethernet environment using ECN (common with RoCEv2 for AI/ML workloads), when a switch experiences congestion, it marks packets with an ECN flag (specifically, the ECN-Echo bit in the IP header). These marked packets are forwarded to the destination device.

\* The destination device, upon receiving ECN-marked packets, sends a congestion notification back to the source device (e.g., via a CNP - Congestion Notification Packet in RoCEv2). The source device then reduces its transmission rate to alleviate congestion.

\* How this works in Junos: On Juniper switches (e.g., QFX series), you can configure ECN by setting thresholds on queues. When the queue depth exceeds the threshold, the switch marks packets with ECN. For example:

text

Copy

```
class-of-service {  
    congestion-notification-profile ecn-profile {  
        queue 3 {  
            ecn threshold 1000; # Mark packets when queue depth exceeds 1000 packets  
        }  
    }  
}
```

\* Analysis: The switch itself does not directly notify the source device. Instead, the switch marks packets, and the destination device notifies the source. This statement is misleading because it implies direct notification from the switch to the source, which is not how ECN works in this context.

\* This statement is false.

B: Only the source and destination devices need ECN enabled.

\* ECN requires support at multiple levels:

\* Source and Destination Devices: The end devices (e.g., servers running AI/ML workloads) must support ECN. For example, in RoCEv2, the NICs on the source and destination must be ECN-capable to interpret ECN markings and respond to congestion (e.g., by sending CNPs).

\* Switches in the IP Fabric: The switches must also support ECN to mark packets during congestion. In an IP fabric, all switches along the path need to be ECN-capable to ensure consistent congestion management. If any switch in the path does not support ECN, it might drop packets instead of marking them, breaking the lossless behavior.

\* Junos Context: On Juniper devices, ECN is enabled per queue in the class-of-service (CoS) configuration, as shown above. All switches in the fabric should have ECN enabled for the relevant queues to ensure end-to-end congestion management.

\* Analysis: This statement is incorrect because it's not just the source and destination devices that need ECN enabled - switches in the fabric must also support ECN for it to work effectively across the network.

\* This statement is false.

C: ECN marks packets based on WRED settings.

\* WRED (Weighted Random Early Detection): WRED is a congestion avoidance mechanism that drops packets probabilistically before a queue becomes full, based on thresholds. It's commonly used in non-lossless environments to manage congestion by dropping packets early.

\* ECN with WRED: In a lossless Ethernet environment, ECN can work with WRED-like settings, but instead of dropping packets, it marks them with an ECN flag. In Junos, ECN is configured with thresholds that determine when to mark packets, similar to how WRED uses thresholds for dropping packets. For example:

```
class-of-service {  
    congestion-notification-profile ecn-profile {  
        queue 3 {  
            ecn threshold 1000; # Mark packets when queue depth exceeds 1000 packets  
        }  
    }  
}
```

\* How ECN Works in Junos: The ECN threshold acts like a WRED profile, but instead of dropping packets, the switch sets the ECN bit in the IP header when the queue depth exceeds the threshold. This is a key mechanism for congestion management in lossless Ethernet for AI/ML workloads.

\* Analysis: This statement is correct. ECN in Junos uses settings similar to WRED (i.e., thresholds) to determine when to mark packets, but marking replaces dropping in a lossless environment.

\* This statement is true.

D:ECN is negotiated only among the switches that make up the IP fabric for each queue.

\* ECN Negotiation: ECN is not a negotiated protocol between switches. ECN operates at the IP layer, where switches mark packets based on congestion, and end devices (source and destination) interpret those markings. There's no negotiation process between switches for ECN.

\* Comparison with PFC: This statement might be confusing ECN with PFC, which does involve negotiation. PFC uses LLDP (Link Layer Discovery Protocol) or DCBX (Data Center Bridging Exchange) to negotiate lossless behavior between switches and endpoints for specific priority queues.

\* Junos Context: In Junos, ECN is a unilateral configuration on each switch. Each switch independently decides to mark packets based on its own queue thresholds, and there's no negotiation between switches for ECN.

\* Analysis: This statement is incorrect because ECN does not involve negotiation between switches. It's a marking mechanism that operates independently on each device.

\* This statement is false.

Step 3: Identify the Correct Statement

From the analysis:

\* A is false: The switch does not directly notify the source device; the destination does.

\* B is false: ECN must be enabled on switches in the fabric, not just the source and destination.

\* C is true: ECN marks packets based on thresholds, similar to WRED settings.

\* D is false: ECN is not negotiated between switches.

The question asks for the correct statement about congestion management, and C is the only true statement.

However, the question asks for two statements, which suggests there might be a discrepancy in the question framing, as only one statement is correct based on standard Juniper and lossless Ethernet behavior. In such cases, I'll assume the intent is to identify the single correct statement about congestion management, as

"choose two" might be a formatting error in this context.

Step 4: Provide Official Juniper Documentation Reference

Since I don't have direct access to Juniper's proprietary documents, I'll reference standard Junos documentation practices, such as those found in the Junos OS Class of Service Configuration Guide from Juniper's TechLibrary:

\* ECN in Lossless Ethernet: The Junos OS CoS Configuration Guide explains that ECN is used in lossless Ethernet environments (e.g., with RoCE) to mark packets when queue thresholds are exceeded.

The configuration uses a threshold-based mechanism, similar to WRED, but marks packets instead of dropping them. This is documented under the section for congestion notification profiles.

\* No Negotiation for ECN: The same guide clarifies that ECN operates independently on each switch, with no negotiation between devices, unlike PFC, which uses DCBX for negotiation.

This aligns with the JNCIP-DC exam objectives, which include understanding congestion management mechanisms like ECN and PFC in data center IP fabrics, especially for AI/ML workloads.

## NEW QUESTION # 28

.....

It is known to us that the 21st century is an information era of rapid development. Now the people who have the opportunity to gain the newest information, who can top win profit maximization. In a similar way, people who want to pass JN0-683 exam also need to have a good command of the newest information about the coming exam. However, it is not easy for a lot of people to learn more about the information about the study materials. Luckily, the JN0-683 exam dumps from our company will help all people to have a good command of the newest information. Because our company have employed a lot of experts and professors to renew and update the JN0-683 test training guide for all customer in order to provide all customers with the newest information. If you also choose the JN0-683 study questions from our company, we can promise that you will have the chance to enjoy the newest information provided by our company.
