ADX-350考試指南，ADX-350考試重點

PDFExamDumps感到最自豪的是能幫助考生通過很難的Salesforce ADX-350考試，我們過去五年的成功率極高，可以讓您在職業生涯里有更好的發展前景。ADX-350是IT專業人士的首選學習資料，特別是那些想自己在工作中有所提供的人。我們的所有產品還不定期推出折扣優惠活動，給考生提供最有效的Salesforce ADX-350考試學習資料。還提供完善的售後服務給顧客，購買ADX-350考古題的顧客可以享受一年的免費更新。

最新的 Mulesoft Developer ADX-350 免費考試真題 (Q47-Q52):

問題 #47

A non-technical employee from AnyAirlines creates a hyperautomation solution. The solution needs to meet the following criteria:
The process needs to begin when a record is created in Salesforce.
Then, it needs to pass data to a pre-existing RPA process which includes a User Task for data integrity purposes.
The output of the RPA process needs to be used to create a record in NetSuite.
According to best practices, how should this automated process be structured?

- A. 1. A MuleSoft Composer flow triggers on the creation of the record and calls the RPA process.
- B. 1. A MuleSoft Composer flow triggers on the creation of the record and calls the RPA process.
- C. 1. A Salesforce flow triggers on the creation of the record and makes an outbound request to a MuleSoft Composer flow.

答案：A

解題說明：

To structure the automated process to meet the given criteria, the following approach is recommended:

MuleSoft Composer Flow Triggers on Record Creation:

Use MuleSoft Composer to create a flow that is triggered when a new record is created in Salesforce. This is done by setting up a trigger event in MuleSoft Composer that listens for new record creation events in Salesforce.

Call the RPA Process:

Once the flow is triggered, it should call the pre-existing RPA process. MuleSoft Composer can invoke MuleSoft RPA bots, and you can pass the necessary data from the Salesforce record to the RPA process.

The RPA process will include the User Task for data integrity purposes.

Use the RPA Process Output to Create a Record in NetSuite:

After the RPA process completes, the MuleSoft Composer flow can capture the output from the RPA process.

The same MuleSoft Composer flow will then use this output to create a record in NetSuite, ensuring a seamless data transfer and process automation.

問題 #48

Northern Trail Outfitters (NTO) is building a hyperautomation solution using Salesforce and MuleSoft. Their Salesforce admin needs to automate a comprehensive, multi-step process that a single user will execute after a case record is created.

How should the Salesforce Flow solution be structured to meet this requirement?

- A. A screen flow to process user inputs and an autolaunched flow to process backend steps automatically
- B. A parent flow with subflows to help organize automated actions and generate reusable components
- C. A single flow Orchestration that uses Stages and Steps to organize automated actions and process user inputs
- D. An autolaunched flow that will process user inputs and conditional logic to automate the process in Salesforce

答案： C

解題說明：

To address the comprehensive, multi-step process automation requirement at Northern Trail Outfitters (NTO), a single flow orchestration that uses Stages and Steps is the best solution.

Flow Orchestration in Salesforce:

Stages and Steps: Flow Orchestration allows Salesforce admins to build sophisticated automations by structuring the flow into Stages (representing different parts of the process) and Steps (individual actions within each Stage).

User Inputs and Automated Actions: By leveraging Stages and Steps, Salesforce Flow Orchestration can handle both user inputs and backend automated steps seamlessly, ensuring the entire process is automated and organized efficiently.

Error Handling and Conditional Logic: It also allows for conditional logic and error handling, ensuring that the flow can adapt to various scenarios that may arise during the automation process.

Comprehensive Process Automation:

Single User Execution: Given that the requirement specifies that a single user will execute the process after a case record is created, Flow Orchestration is ideal as it can manage the end-to-end process in a structured manner, without requiring multiple flows or complex configurations.

Salesforce documentation on Flow Orchestration provides detailed insights on how to design and implement such solutions.

問題 #49

Northern Trail Outfitters must create a near real-time inventory API that can be used within its retail POS systems, across its mobile and online stores, and by its strategic B2B e-commerce partners. The API must provide accurate and up-to-date product inventory levels. The data currently resides in both SAP and NetSuite.

According to best practices, which hyperautomation tool should be used to build this solution?

- A. MuleSoft Composer
- B. Anypoint Platform
- C. Salesforce Flow
- D. MuleSoft RPA

答案： B

解題說明：

To create a near real-time inventory API that integrates data from SAP and NetSuite and can be used across various platforms and partners, the Anypoint Platform is the most suitable tool:

Anypoint Platform:

Anypoint Platform provides comprehensive integration capabilities, including real-time data processing, API management, and connectivity to various systems like SAP and NetSuite.

It supports building robust, scalable APIs that can handle near real-time data synchronization, ensuring accurate and up-to-date inventory levels across multiple channels.

Best Practices:

Using Anypoint Platform, you can design and manage APIs with fine-grained control over security, performance, and monitoring, adhering to best practices for enterprise integration.

問題 #50

Northern Trail Outfitters developed an integration between its two Salesforce orgs using MuleSoft Composer. Which two actions should be taken before testing the Composer flow? (Choose two.)

- A. Ensure the flow trigger is connected to a sandbox instance of Salesforce.
- B. Ensure action steps are connected to a sandbox instance of Salesforce.
- C. Ensure MuleSoft Composer is installed on both the source and target orgs.
- D. Ensure the credentials to the target production org are still valid.

答案: A,B

解題說明:

* Flow Trigger Connection: Before testing any Composer flow, it is crucial to connect the flow trigger to a sandbox instance of Salesforce. This ensures that testing does not impact the production environment. The sandbox provides a safe space to simulate real-world conditions without the risk of data corruption or unintended actions in the live system.

* Action Steps Connection: Similar to the flow trigger, action steps within the Composer flow should also be connected to a sandbox instance. This allows comprehensive testing of the flow's functionality, ensuring that each step performs as expected without affecting the production data.

* Ensuring Validity of Credentials: While it is important to ensure that credentials to the production org are valid when moving to production, for testing purposes, the emphasis is on sandbox connections. The credentials should be verified to avoid disruptions during testing.

* Installation of MuleSoft Composer: MuleSoft Composer does not need to be installed on both the source and target orgs as it operates independently and connects to these orgs through provided credentials.

問題 #51

AnyAirlines has an RPA process that is failing in Production. According to best practices, how should they debug the failure?

- A. Download the analysis package from RPA Manager. revert the RPA process to the Build phase, then import the analysis package to RPA Builder and debug.
- B. Download the analysis package from RPA Manager. revert the RPA process to the Test phase, then import the analysis package to RPA Builder and debug.
- C. Download the analysis package from RPA Manager, open it in a text editor, then determine the root cause.
- D. Deactivate the RPA process, enter the inputs manually, the monitor the execution to determine the root cause.

答案: A

解題說明:

* Download the Analysis Package: The first step is to download the analysis package from the RPA Manager. This package contains logs and detailed execution data that are crucial for debugging.

* Revert to Build Phase: Reverting the RPA process to the Build phase allows developers to make changes and debug the process. The Build phase is where the RPA process is designed and configured.

* Import to RPA Builder: Import the analysis package into RPA Builder, which is the tool used to develop and debug RPA processes. This allows for a detailed investigation and identification of the root cause of the failure.

* Debugging: Use the detailed logs and execution data within RPA Builder to step through the process, identify issues, and implement fixes. This is the most effective method for diagnosing and resolving issues in RPA processes.

問題 #52
