Our CT-GenAI exam training' developers to stand in the perspective of candidate and meet the conditions for each user to tailor their CT-GenAI learning materials. What's more, our CT-GenAI guide questions are cheap and cheap, and we buy more and deliver more. The more customers we buy, the bigger the discount will be. In order to make the user a better experience to the superiority of our CT-GenAI Actual Exam guide, we also provide considerate service, users have any questions related to our CT-GenAI study materials, can get the help of our staff in a timely manner.

The field of ISQI is growing rapidly and you need the ISQI CT-GenAI certification to advance your career in it. But clearing the ISTQB Certified Tester Testing with Generative AI (CT-GenAI) v1.0 (CT-GenAI) test is not an easy task. Applicants often don't have enough time to study for the CT-GenAI Exam. They are in desperate need of real CT-GenAI exam questions which can help them prepare for the ISTQB Certified Tester Testing with Generative AI (CT-GenAI) v1.0 (CT-GenAI) test successfully in a short time.

## Latest CT-GenAI Dumps | Test CT-GenAI Dump

Our CT-GenAI learning materials provide multiple functions and considerate services to help the learners have no inconveniences to use our product. We guarantee to the clients if only they buy our CT-GenAI study materials and learn patiently for some time they will be sure to pass the CT-GenAI test with few failure odds. The pass rate of our CT-GenAI exam questions is high as 98% to 100%, which is unique in the market. And the data also proved and tested the high-quality of our CT-GenAI practice guide.

## ISQI ISTQB Certified Tester Testing with Generative AI (CT-GenAI) v1.0 Sample Questions (Q13-Q18):

### NEW QUESTION # 13

Which statement BEST describes vision-language models (VLMs)?

- A. VLMs are a subset of multimodal LLMs integrating visual and textual information.
- B. VLMs are unrelated to multimodal LLMs and focus only on UI automation.
- C. VLMs process audio and video but not images.
- D. VLMs are a superset of multimodal LLMs.

**Answer: A**

Explanation:

Vision-Language Models (VLMs) represent a specialized subset of multimodal Large Language Models.

Their defining characteristic is the ability to process, understand, and reason across both textual and visual modalities simultaneously. In the field of software testing, VLMs are revolutionary because they allow the AI to "see" a User Interface (UI). A tester can provide a screenshot of a web page alongside a natural language prompt, and the VLM can identify UI elements, detect visual

regressions, or even validate that the visual layout matches a design specification. They are not a "superset" (Option C) of multimodal AI, but rather a specific implementation of it focused on the intersection of sight and language. Unlike traditional OCR or pixel-comparison tools used in legacy UI automation (Option B), VLMs understand the context of what they see—for instance, identifying a "broken" button icon that a human would recognize but a rule-based script might miss. This integration of visual and textual data is what makes them a vital component of modern, AI-augmented Quality Assurance strategies.

#### NEW QUESTION # 14

What is a hallucination in LLM outputs?

- A. A systematic preference learned from data
- **B. Generation of factually incorrect content for the task**
- C. A logical mistake in multi-step deduction
- D. A transient network failure during inference

**Answer: B**

Explanation:

A hallucination refers to a phenomenon where a Large Language Model generates text that is grammatically correct and seemingly plausible but is factually incorrect or unsupported by the provided context or real-world data. In the context of software testing, this is a critical limitation. For example, an LLM might generate a test case for a software feature that does not exist or cite a non-existent API parameter. These errors occur because LLMs are probabilistic engines designed to predict the "most likely" next token rather than "reasoning" from a set of verified facts. They do not have a built-in "truth" mechanism. While a logical mistake (Option B) is a failure in reasoning and a systematic preference (Option D) describes bias, a hallucination is specifically about the fabrication of information. Testers must be particularly vigilant regarding hallucinations, as they can lead to "false confidence" in test coverage or the creation of invalid bug reports. Mitigations include grounding the model with Retrieval-Augmented Generation (RAG) and implementing rigorous "human-in-the-loop" verification of all AI-generated test artifacts.

#### NEW QUESTION # 15

Which statement about fine-tuning for test tasks is INCORRECT?

- A. It enhances relevance to organizational terminology and formats
- **B. It replaces the model's general knowledge entirely and prevents overfitting**
- C. It can be applied to smaller SLMs to improve task performance with lower compute
- D. It adapts a pre-trained model to a domain using task-specific data

**Answer: B**

Explanation:

The statement that fine-tuning "replaces the model's general knowledge entirely" is incorrect. Fine-tuning is a process of "incremental learning" where a pre-trained model (which already possesses vast general knowledge) is further trained on a smaller, domain-specific dataset—such as an organization's internal API documentation or historical test scripts. The goal is to adjust the model's internal weights so that it becomes more proficient in a specific area (Option A) and adheres better to local terminology and formatting standards (Option C). It does not erase the foundational language capabilities of the model. Furthermore, fine-tuning is a common strategy for Small Language Models (SLMs) to allow them to punch above their weight class in specific tasks while remaining computationally efficient (Option D). However, if done poorly, fine-tuning can actually cause overfitting (where the model becomes too rigid and loses its ability to generalize), rather than preventing it. Therefore, fine-tuning should be viewed as a "specialization" layer rather than a total replacement of the model's base intelligence.

#### NEW QUESTION # 16

What does an embedding represent in an LLM?

- A. Logical rules for reasoning
- B. Tokens grouped into context windows
- **C. Numerical vectors capturing semantic relationships**
- D. A set of test cases for validation

**Answer: C**

Explanation:

Embeddings are a fundamental concept in modern Natural Language Processing (NLP) and LLMs. They are high-dimensional numerical vectors—essentially lists of numbers—that represent the meaning (semantics) of a piece of text (a word, sentence, or document). Unlike traditional keyword matching, which looks for identical strings of characters, embeddings allow the model to understand the "closeness" of concepts. For example, in a vector space, the word "bug" would be mathematically closer to "defect" or "error" than to

"feature" or "requirement." This captures the semantic relationship between terms. This technology is the backbone of Retrieval-Augmented Generation (RAG) used in testing: when a tester queries a documentation set, the system converts the query into an embedding and looks for other chunks of text with similar vector values. This allows the AI to retrieve relevant context even if the exact keywords do not match. It is not about logical rules (Option C) or groups of tokens (Option A), but rather a mathematical representation of language that enables machines to process human meaning.

#### NEW QUESTION # 17

A prompt begins: "You are a senior test manager responsible for risk-based test planning on a payments platform." Which component is this?

- **A. Role**
- B. Instruction
- C. Context
- D. Constraints

**Answer: A**

Explanation:

In structured prompt engineering, the Role component (also known as a Persona) is used to set the perspective, expertise, and tone of the LLM's response. By assigning the role of a "senior test manager," the tester instructs the model to adopt the specific domain knowledge, vocabulary, and professional standards associated with that position. This technique is highly effective because LLMs are trained on vast datasets containing diverse professional documents; invoking a specific persona helps the model narrow its "latent space" to retrieve information relevant to that specific field. For instance, a senior test manager persona will prioritize risk management, resource allocation, and high-level strategy, whereas a "junior developer" persona might focus more on syntax and local unit tests. While Context (Option B) provides the background of the project and Instruction (Option A) defines the specific task to be performed, the Role serves as the foundation for how those instructions are interpreted. This ensures the generated testware aligns with the expected professional seniority and organizational maturity required for high-stakes environments like a payments platform.

#### NEW QUESTION # 18

.....

We are carrying out renovation about CT-GenAI test engine all the time to meet the different requirements of the diversified production market. Thus we have prepared three kinds of versions on CT-GenAI preparation materials. If you are used to study with paper-based materials you can choose the PDF version of our CT-GenAI Study Guide. If you would like to get the mock test before the real CT-GenAI exam you can choose the software version, and if you want to study in anywhere at any time then our online APP version is your best choice since you can download it in any electronic devices.
