

GitHub Advanced Security Updated Torrent & GH-500 Training Vce & GitHub Advanced Security Pdf Exam

BTW, DOWNLOAD part of Prep4pass GH-500 dumps from Cloud Storage: https://drive.google.com/open?id=1SoWiT3aw52o6SRnLA74u2iyMAcileMH_

Our GH-500 practice braindumps not only apply to students, but also apply to office workers; not only apply to veterans in the workplace, but also apply to newly recruited newcomers. And our GH-500 study materials use a very simple and understandable language, to ensure that all people can learn and understand. Besides, our GH-500 Real Exam also allows you to avoid the boring of textbook reading, but let you master all the important knowledge in the process of doing exercises.

Microsoft GH-500 is one of the important certification exams. Prep4pass's experienced IT experts through their extensive experience and professional IT expertise have come up with IT certification exam study materials to help people pass Microsoft Certification GH-500 Exam successfully. Prep4pass's providing learning materials can not only help you 100% pass the exam, but also provide you a free one-year update service.

GH-500 Reliable Exam Online & Vce GH-500 Torrent

We all have same experiences that some excellent people around us further their study and never stop their pace even though they have done great job in their surrounding environment. So it is of great importance to make yourself competitive as much as possible. Facing the GH-500 exam this time, your rooted stressful mind of the exam can be eliminated after getting help from our GH-500 practice materials. Among voluminous practice materials in this market, we highly recommend our GH-500 Study Tool for your reference. Their vantages are incomparable and can spare you from strained condition. On the contrary, they serve like stimulants and catalysts which can speed up you efficiency and improve your correction rate of the GH-500 real questions during your review progress.

Microsoft GH-500 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Describe GitHub Advanced Security best practices, results, and how to take corrective measures: This section evaluates skills of Security Managers and Development Team Leads in effectively handling GHAS results and applying best practices. It includes using Common Vulnerabilities and Exposures (CVE) and Common Weakness Enumeration (CWE) identifiers to describe alerts and suggest remediation, decision-making processes for closing or dismissing alerts including documentation and data-based decisions, understanding default CodeQL query suites, how CodeQL analyzes compiled versus interpreted languages, the roles and responsibilities of development and security teams in workflows, adjusting severity thresholds for code scanning pull request status checks, prioritizing secret scanning remediation with filters, enforcing CodeQL and Dependency Review workflows via repository rulesets, and configuring code scanning, secret scanning, and dependency analysis to detect and remediate vulnerabilities earlier in the development lifecycle, such as during pull requests or by enabling push protection.

Topic 2	<ul style="list-style-type: none"> • Configure and use secret scanning: This domain targets DevOps Engineers and Security Analysts with the skills to configure and manage secret scanning. It includes understanding what secret scanning is and its push protection capability to prevent secret leaks. Candidates differentiate secret scanning availability in public versus private repositories, enable scanning in private repos, and learn how to respond appropriately to alerts. The domain covers alert generation criteria for secrets, user role-based alert visibility and notification, customizing default scanning behavior, assigning alert recipients beyond admins, excluding files from scans, and enabling custom secret scanning within repositories.
Topic 3	<ul style="list-style-type: none"> • Configure and use Dependabot and Dependency Review: Focused on Software Engineers and Vulnerability Management Specialists, this section describes tools for managing vulnerabilities in dependencies. Candidates learn about the dependency graph and how it is generated, the concept and format of the Software Bill of Materials (SBOM), definitions of dependency vulnerabilities, Dependabot alerts and security updates, and Dependency Review functionality. It covers how alerts are generated based on the dependency graph and GitHub Advisory Database, differences between Dependabot and Dependency Review, enabling and configuring these tools in private repositories and organizations, default alert settings, required permissions, creating Dependabot configuration files and rules to auto-dismiss alerts, setting up Dependency Review workflows including license checks and severity thresholds, configuring notifications, identifying vulnerabilities from alerts and pull requests, enabling security updates, and taking remediation actions including testing and merging pull requests.
Topic 4	<ul style="list-style-type: none"> • Configure and use Code Scanning with CodeQL: This domain measures skills of Application Security Analysts and DevSecOps Engineers in code scanning using both CodeQL and third-party tools. It covers enabling code scanning, the role of code scanning in the development lifecycle, differences between enabling CodeQL versus third-party analysis, implementing CodeQL in GitHub Actions workflows versus other CI tools, uploading SARIF results, configuring workflow frequency and triggering events, editing workflow templates for active repositories, viewing CodeQL scan results, troubleshooting workflow failures and customizing configurations, analyzing data flows through code, interpreting code scanning alerts with linked documentation, deciding when to dismiss alerts, understanding CodeQL limitations related to compilation and language support, and defining SARIF categories.
Topic 5	<ul style="list-style-type: none"> • Describe the GHAS security features and functionality: This section of the exam measures skills of Security Engineers and Software Developers and covers understanding the role of GitHub Advanced Security (GHAS) features within the overall security ecosystem. Candidates learn to differentiate security features available automatically for open source projects versus those unlocked when GHAS is paired with GitHub Enterprise Cloud (GHEC) or GitHub Enterprise Server (GHES). The domain includes knowledge of Security Overview dashboards, the distinctions between secret scanning and code scanning, and how secret scanning, code scanning, and Dependabot work together to secure the software development lifecycle. It also covers scenarios contrasting isolated security reviews with integrated security throughout the development lifecycle, how vulnerable dependencies are detected using manifests and vulnerability databases, appropriate responses to alerts, the risks of ignoring alerts, developer responsibilities for alerts, access management for viewing alerts, and the placement of Dependabot alerts in the development process.

Microsoft GitHub Advanced Security Sample Questions (Q73-Q78):

NEW QUESTION # 73

Which of the following features helps to prioritize secret scanning alerts that present an immediate risk?

- A. Custom pattern dry runs
- B. Push protection
- **C. Secret validation**
- D. Non-provider patterns

Answer: C

Explanation:

Secret validation checks whether a secret found in your repository is still valid and active with the issuing provider (e.g., AWS, GitHub, Stripe). If a secret is confirmed to be active, the alert is marked as verified, which means it's considered a high-priority issue because it presents an immediate security risk.

This helps teams respond faster to valid, exploitable secrets rather than wasting time on expired or fake tokens.

NEW QUESTION # 74

When using CodeQL, what extension stores query suite definitions?

- **A. .qls**
- B. .qll
- C. .yaml
- D. .ql

Answer: A

Explanation:

Query suite definitions in CodeQL are stored using the .qls file extension. A query suite defines a collection of queries to be run during an analysis and allows for grouping them based on categories like language, security relevance, or custom filters.

In contrast:

.ql files are individual queries.

.qll files are libraries used by .ql queries.

.yaml is used for workflows, not query suites.

NEW QUESTION # 75

Which of the following information can be found in a repository's Security tab?

- **A. Number of alerts per GHAS feature**
- B. GHAS settings
- C. Two-factor authentication (2FA) options
- D. Access management

Answer: A

Explanation:

The Security tab in a GitHub repository provides a central location for viewing security-related information, especially when GitHub Advanced Security is enabled. The following can be accessed:

Number of alerts related to:

Code scanning

Secret scanning

Dependency (Dependabot) alerts

Summary and visibility into open, closed, and dismissed security issues.

It does not show 2FA options, access control settings, or configuration panels for GHAS itself. Those belong to account or organization-level settings.

NEW QUESTION # 76

Which security feature shows a vulnerable dependency in a pull request?

- A. The repository's Security tab

- B. Dependabot alert
- **C. Dependency review**
- D. Dependency graph

Answer: C

Explanation:

Dependency review runs as part of a pull request and shows which dependencies are being added, removed, or changed - and highlights vulnerabilities associated with any added packages.

It works in real-time and is specifically designed for use during pull request workflows.

The dependency graph is an overview, Dependabot alerts notify post-merge, and the Security tab shows the aggregated alert list.

NEW QUESTION # 77

What were the long-term impacts of the Cultural Revolution on Chinese society?

- A. Write
- B. Maintain
- C. Triage
- **D. Admin**

Answer: D

Explanation:

Requesting a CVE ID for a security advisory in a GitHub repository requires Admin permissions. This level of access is necessary because it involves managing sensitive security information and coordinating with external entities to assign a CVE, which is a formal process that can impact the public perception and security posture of the project.

NEW QUESTION # 78

.....

The Prep4pass is committed to providing the best possible study material to succeed in the GitHub Advanced Security (GH-500) exam. With actual PDF questions, customizable practice exams, and 24/7 support, customers can be confident that they are getting the best possible prep material. The Prep4pass GH-500 is an excellent choice for anyone looking to advance their career with the certification. Buy Now.
