The privacy protection of users is an eternal issue in the internet age. Many illegal websites will sell users' privacy to third parties, resulting in many buyers are reluctant to believe strange websites. But you don't need to worry about it at all when buying our JN0-106 Learning Engine. We assure you that we will never sell users' information on the JN0-106 exam questions because it is damaging our own reputation. And we will help you on the JN0-106 study materials if you have any question.

If you want to get some achievement in the IT field Juniper certifications will be a stepping-stone. In fact high senior positions have a large demand. JN0-106 new test braindumps will pave the way for you to clear exam and obtain a certification. If you are an experienced IT test engine, owing one certification under the help of JN0-106 new test braindumps will improve your value; companies may have more cooperation opportunities.

## Reliable JN0-106 Practice Materials - JN0-106 Real Study Guide - RealValidExam

Our JN0-106 practice materials have picked out all knowledge points for you, which helps you get rid of many problems. In addition, time is money in modern society. It is important to achieve all things efficiently. So our JN0-106 study guide just needs less time input, which can suit all people's demands. In the meantime, all knowledge points of our JN0-106 Preparation questions have been adapted and compiled carefully to ensure that you absolutely can understand it quickly.

### Juniper JN0-106 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Routing Fundamentals: Covers core routing concepts on Junos devices, including routing and forwarding tables, route preference, static routing, routing instances, and an introduction to dynamic routing protocols.</li></ul>

Topic 2	<ul style="list-style-type: none"> <li>• Routing Policy and Firewall Filters: Covers how to control traffic flow on Junos devices using routing policies and firewall filters, including policy structure, match criteria, filter actions, and unicast RPF.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• Configuration Basics: Covers the essential steps for configuring a Junos device from factory default, including user accounts, interfaces, authentication, system services like NTP and SNMP, and configuration archival.</li> </ul>

## Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q166-Q171):

### NEW QUESTION # 166

What are two link-state routing protocols? (Choose two.)

- A. OSPF
- B. RIP
- C. BGP
- D. IS-IS

**Answer: A,D**

Explanation:

Link-state routing protocols are a type of routing protocol used in packet-switching networks for finding the best path between source and destination. OSPF (Open Shortest Path First) and IS-IS (Intermediate System to Intermediate System) are both examples of link-state routing protocols.

They work by maintaining a complete map or topology of the network, allowing routers to independently calculate the best path to each destination. Unlike distance-vector protocols like RIP, link-state protocols are more efficient and scalable, making them suitable for larger networks.

### NEW QUESTION # 167

What are two requirements for root password recovery in Junos? (Choose two.)

- A. You must have saved the rescue configuration in advance.
- B. You must load the factory default configuration.
- C. You must reboot the device.
- D. You must have console access to the device.

**Answer: C,D**

Explanation:

Root password recovery in Junos OS is a critical administrative procedure designed to regain access to the management plane when the root credentials are lost. This process is fundamentally tied to the physical security of the device, as it requires two specific conditions that cannot be met over a standard network connection. First, the administrator must have direct console access to the device. Because the recovery process involves interrupting the Junos boot sequence before the operating system kernel and its associated security services (such as SSH) are fully initialized, it must be performed through the serial management port.

Second, a system reboot is mandatory. The recovery mechanism is triggered by interrupting the boot loader (typically the "Loader" or "U-Boot" stage) by pressing the Space bar or a specific key sequence during power-on. This allows the administrator to enter "single-user mode" or boot into a "recovery" state. Once in this restricted environment, the device mounts its internal storage in a way that permits the modification of the root authentication parameters without requiring the existing password. This workflow intentionally bypasses the standard authentication database to restore management control while preserving the rest of the device configuration. This procedure underscores the importance of securing physical access to the chassis, as anyone with console access and the ability to cycle power can eventually gain root-level authority over the system.

### NEW QUESTION # 168

Which two components are included in a transport header? (Choose two.)

- A. destination port number
- B. source port number

- C. destination MAC address
- D. source MAC address

**Answer: A,B**

Explanation:

The transport layer in the OSI model is responsible for end-to-end communication and error recovery. In a transport header, such as TCP or UDP, the key components include the source port number and the destination port number. These port numbers are used to identify sending and receiving applications. The source port number indicates the port of the sending application, and the destination port number refers to the port of the receiving application. MAC addresses, on the other hand, are part of the data link layer (Layer 2) and would be included in an Ethernet header, not a transport header.

### NEW QUESTION # 169

You want to automatically back up your Junos device configuration to an external server every time you commit a configuration change. In this scenario, which command would accomplish this task?

- A. set system archival configuration archive-sites
- **B. set system archival configuration transfer-on-commit**
- C. set system archival configuration transfer-interval
- D. set system commit synchronize

**Answer: B**

Explanation:

Junos OS provides robust automation features for configuration management, specifically through the system archival utility. When an administrator needs to ensure that every successful configuration change is mirrored to an off-box repository for disaster recovery or auditing, the transfer-on-commit statement is the appropriate tool. This command instructs the Junos device to initiate an automated upload process immediately following the validation and activation of a commit command.

To fully implement this, the administrator must also define the archive-sites, which specify the destination URIs (using protocols such as FTP, SCP, or HTTP) and the necessary credentials for the external server.

While transfer-interval can be used to back up configurations on a chronological schedule (e.g., every 60 minutes), transfer-on-commit is superior for tracking specific change events as they happen. This ensures that the external backup is always synchronized with the current active configuration on the device. Once configured, the device handles the background transfer, allowing the administrator to maintain a historical record of configuration states without manual intervention, which is essential for large-scale operational environments.

### NEW QUESTION # 170

What are two fiber-optic connector types? (Choose two.)

- A. RJ-45
- **B. LC**
- C. BNC
- **D. SC**

**Answer: B,D**

Explanation:

Physical layer connectivity for Junos devices involves a variety of media types, with fiber-optic cabling being the standard for high-speed, long-distance, or high-density uplink requirements. Two of the most prevalent connector types used in these environments are the LC (Lucent Connector) and the SC (Subscriber Connector).

The LC connector is a small-form-factor (SFF) connector that uses a 1.25 mm ferrule. Due to its compact size and "push-and-latch" mechanism, it is the primary connector type found on SFP, SFP+, and XFP transceivers used in Juniper EX, MX, and QFX series hardware. Its high-density design allows for more ports in a limited space on a line card or chassis. The SC connector, often referred to as a "square connector," utilizes a larger 2.5 mm ferrule and a "push-pull" snapping mechanism. While it was highly common in older legacy hardware and fiber patch panels, it has largely been superseded by the LC in modern data center and enterprise switching environments.

In contrast, the RJ-45 is a standard copper Ethernet connector (typically used with Category 5e/6 cables), and the BNC (Bayonet Neill-Concelman) is a miniature quick connect/disconnect RF connector used for coaxial cable. As a Senior Architect, distinguishing

between these physical interfaces is critical when specifying the correct Small Form-factor Pluggable (SFP) modules and patch cables required to bring a Junos interface into an operational up/up state.
