

SAP Certified - Database Administrator - SAP HANA pdf vce dumps & C_DBADM_2601 free download training collection

If you are also facing the same problem then you are at the trusted spot. FreeCram offers updated and real SAP C_DBADM_2601 Exam Dumps for SAP Certified - Database Administrator - SAP HANA (C_DBADM_2601) test takers who want to prepare quickly for the SAP Certified - Database Administrator - SAP HANA (C_DBADM_2601) examination. These actual C_DBADM_2601 exam questions have been compiled by a team of professionals after a thorough analysis of past papers and current content of the C_DBADM_2601 test. If students prepare with these valid SAP Certified - Database Administrator - SAP HANA (C_DBADM_2601) questions, they will surely become capable of clearing the SAP Certified - Database Administrator - SAP HANA (C_DBADM_2601) examination within a few days.

The latest C_DBADM_2601 dumps pdf covers every topic of the certification exam and contains the latest test questions and answers. By practicing our C_DBADM_2601 vce pdf, you can test your skills and knowledge for the test and make well preparation for the formal exam. One-year free updating will ensure you get the Latest C_DBADM_2601 Study Materials first time and the accuracy of our C_DBADM_2601 exam questions guarantee the high passing score.

Download SAP C_DBADM_2601 Demo, C_DBADM_2601 Trusted Exam Resource

The C_DBADM_2601 practice test of FreeCram is created and updated after feedback from thousands of professionals. Additionally, we also offer up to free C_DBADM_2601 exam dumps updates. These free updates will help you study as per the SAP C_DBADM_2601 latest examination content. Our valued customers can also download a free demo of our SAP C_DBADM_2601 exam dumps before purchasing.

SAP Certified - Database Administrator - SAP HANA Sample Questions (Q180-Q185):

NEW QUESTION # 180

A transportation company maintains an on-premises SAP HANA database for dispatch operations while newer planning data is being moved into SAP HANA Cloud. During a recovery readiness review, the administrator confirms that full backups are being created on schedule. However, a validation exercise shows that the expected recovery point for recent operational updates cannot be reached during simulation.

The backup catalog is present, and database availability remains normal. One team member proposes creating an additional full

backup immediately to strengthen protection. The service manager instead wants the next action to close the recovery exposure for current operations, not only improve future coverage.

What is the best next action?

- **A. Verify whether the available backup chain supports the required recovery point and correct the missing continuity before changing the backup schedule.**
- B. Restart the backup-related services so that the recovery simulation recalculates against the latest available catalog entries.
- C. Delay further action because normal database availability proves the current protection model is operationally sufficient.
- D. Create a new full backup immediately because a fresh backup is the fastest way to improve recovery assurance.

Answer: A

Explanation:

Feedback:

The problem is not absence of full backups. The key artifact is that the required recovery point cannot be reached during validation. That indicates a continuity or recoverability gap in the backup chain, not simply a shortage of recent full backups. The correct step is to verify whether the current backup sequence actually supports the required point-in-time recovery target and correct the missing continuity.

NEW QUESTION # 181

A regional online learning provider runs SAP HANA for learner activity analytics. SAP HANA cockpit shows the database as available, but a troubleshooting review shows that several slow report executions were recorded without related workload details in the monitoring history. The alert log exists, but the evidence needed to identify the statement pattern is incomplete for the affected interval. A support analyst suggests increasing timeout values because users eventually received their reports.

The constraint is that the administrator must restore diagnostic visibility before changing report or capacity settings. The next analysis window must be monitored with enough detail to connect performance symptoms to workload evidence.

Which action best addresses the troubleshooting evidence gap?

- A. Increase report timeout values so delayed executions can complete without generating more support tickets.
- B. Restart SAP HANA so the monitoring history begins collecting new entries from a clean runtime state.
- C. Close the troubleshooting review because the alert log proves that performance monitoring detected the issue.
- **D. Enable or correct the required workload-detail collection, reproduce or monitor the affected interval, and validate diagnostic evidence.**

Answer: D

Explanation:

Feedback:

This acts at the diagnostic collection layer indicated by the incomplete evidence. Correcting workload-detail collection and validating it during the affected interval aligns symptom detection, workload capture, troubleshooting analysis, and corrective decision-making.

NEW QUESTION # 182

A regional agricultural cooperative is rehearsing migration from SAP HANA on-premises to SAP HANA Cloud. The source export finishes, and the cloud target is reachable. During validation, the administrator sees that the imported dataset can be queried, but the migration record does not include confirmation that the cloud-side monitoring view has been added to the operations checklist. The project coordinator wants to approve the rehearsal because the data query succeeded.

The constraint is that the administrator must support phased modernization while ensuring the migrated target can be monitored after cutover. Approval must not rely only on data access from the cloud database.

What should the administrator recommend?

- **A. Add and verify cloud-side monitoring evidence in the operations checklist, then approve the rehearsal only after target monitoring is confirmed.**
- B. Repeat the source export because missing monitoring evidence means the data movement probably failed.
- C. Defer monitoring checklist updates until after production cutover so the migration schedule is not delayed.
- D. Approve the rehearsal because successful target queries prove that the SAP HANA Cloud migration is ready.

Answer: A

Explanation:

Feedback:

This resolves the post-migration operations gap at the target validation layer. Adding and verifying cloud-side monitoring evidence confirms that transfer, target query access, monitoring readiness, and approval evidence are aligned.

NEW QUESTION # 183

A financial operations team uses SAP HANA for internal reconciliation reporting. The administrator reviews backup monitoring after a scheduled maintenance cycle. SAP HANA cockpit shows the latest data backup as completed, but the backup validation report flags that the configured retention cleanup removed older log backup files earlier than expected. The system is available, and the reporting team has not reported any issue.

The constraint is that the administrator must protect the required recovery window before accepting the backup state as production-ready. The operations policy allows cleanup automation, but the backup and log retention behavior must still support the agreed recovery coverage.

What should the administrator do next?

- A. Accept the backup state because the most recent data backup completed successfully.
- B. Restart backup monitoring so the validation report can be generated from a refreshed runtime state.
- C. Disable all backup cleanup automation so no backup files are removed in future cycles.
- **D. Correct the retention setting to preserve the required log backup range, then validate recoverability for the agreed window.**

Answer: D

Explanation:

Feedback:

This corrects the upstream backup lifecycle setting that caused the recovery window gap. Validating recoverability after the retention adjustment confirms that backup configuration, log availability, and recovery execution support the required coverage.

NEW QUESTION # 184

CHALLENGE 2 - Replenishment Analytics Monitoring Baseline

Inventory availability analytics took longer during the evening replenishment review. The merchandising operations lead asks for tuning before the next remediation checkpoint, but current monitoring thresholds still reflect earlier regional reporting patterns. What should the database owner do first?

- A. Disable evening monitoring so the next checkpoint focuses only on whether reports complete.
- B. Move the tuning decision to SAP HANA Cloud because the reporting workload may migrate later.
- C. Apply tuning immediately because replenishment reporting affects store planning decisions.
- **D. Validate threshold relevance and capture the current monitoring baseline before approving tuning.**

Answer: D

Explanation:

Feedback:

The database owner should validate threshold relevance and capture the current monitoring baseline before tuning. This protects remediation evidence from being altered before the current workload behavior is understood.

NEW QUESTION # 185

.....

New SAP Certified - Database Administrator - SAP HANA C_DBADM_2601 study guide and latest learning materials and practice materials have been provide for customers. FreeCram is a good platform that has been providing reliable, true, updated, and free SAP Certified - Database Administrator - SAP HANA C_DBADM_2601 Exam Questions. The SAP Certified - Database Administrator - SAP HANA C_DBADM_2601 exam fee is affordable, in order to success in your career, you need to pass SAP Certified - Database Administrator - SAP HANA exam.
