Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q169-Q174):

NEW QUESTION # 169

Which of the following network technologies is commonly used to connect devices within a local area network (LAN)?

- A. VPN
- B. DSL
- C. Wi-Fi
- D. Ethernet

Answer: D

Explanation:

Ethernet is a widely used network technology for connecting devices within a local area network (LAN). It provides a physical and

data link layer protocol for wired connections, allowing devices to communicate over a LAN using Ethernet cables. Ethernet has various speeds and standards, including Ethernet over twisted pair (such as Cat 5e or Cat 6 cables), fiber optic cables, and other mediums.

NEW QUESTION # 170

Which cryptographic technique is used to ensure the integrity of data without the ability to reverse the process?

- A. Hashing algorithm
- B. Digital signature
- C. Symmetric encryption
- D. Asymmetric encryption

Answer: A

Explanation:

Hashing is a cryptographic technique where an input (data/message) is processed through an algorithm to produce a fixed-size output, known as a hash value. The key characteristic of hashing is that it is a one-way function, meaning that it is computationally infeasible to reverse the process and derive the original input from the hash value. Hashing is commonly used to verify data integrity, as even a small change in the input will result in a significantly different hash value.

NEW QUESTION # 171

Which of the following is a common security threat that targets web applications?

- A. Distributed Denial of Service (DDoS)
- B. SQL injection
- C. DNS poisoning
- D. Man-in-the-middle attack

Answer: B

Explanation:

Option 1: Correct: SQL injection is a common security threat that targets web applications. It involves inserting malicious SQL code into input fields to manipulate the application's database and gain unauthorized access or retrieve sensitive information.

Option 2: Incorrect: DNS poisoning is not a common security threat that targets web applications. It involves corrupting the DNS cache and redirecting users to malicious websites.

Option 3: Incorrect: Man-in-the-middle attack is not a common security threat that specifically targets web applications. It involves intercepting communication between two parties and can affect various types of network communication.

Option 4: Incorrect: Distributed Denial of Service (DDoS) is not a common security threat that targets web applications specifically. It involves overwhelming a target system with a flood of traffic from multiple sources, rendering it inaccessible.

NEW QUESTION # 172

Which of the following is an example of a strong password?

- A. "abcdabcd"
- B. "123456"
- C. "StR0ngP@\$Sw0rd!"
- D. "Password123"

Answer: C

Explanation:

A strong password is one that is complex, long, and difficult to guess. It should contain a combination of uppercase and lowercase letters, numbers, and special characters. In this case, "StR0ngP@\$Sw0rd!" meets these criteria, making it a strong password. The other options are weak passwords as they are easily guessable, commonly used, or lack complexity.

NEW QUESTION # 173

Which encryption method uses a single key to both encrypt and decrypt data?

- A. SSL/TLS
- B. Hashing
- **C. Symmetric encryption**
- D. Asymmetric encryption

Answer: C

Explanation:

Symmetric encryption uses a single key to both encrypt and decrypt data. This means that the same key is used by both the sender and the receiver to secure the communication. It is faster and less computationally intensive than asymmetric encryption.
