

Valid Braindumps Observability-Self-Hosted-Fundamentals Pdf & Observability-Self-Hosted-Fundamentals Test Pattern

P.S. Free & New Observability-Self-Hosted-Fundamentals dumps are available on Google Drive shared by Test4Sure:
<https://drive.google.com/open?id=1Kg1wOoK570UH-Rh7OLain2uhX41BJ4p>

The SolarWinds Observability-Self-Hosted-Fundamentals web-based practice test software is very user-friendly and simple to use. It is accessible on all browsers. It will save your progress and give a report of your mistakes which will surely be beneficial for your overall exam preparation. A useful certification will bring you much outstanding advantage when you apply for any jobs about SolarWinds company or products.

Test4Sure can develop well until now. Our developmental force comes from those who have obtained Observability-Self-Hosted-Fundamentals exam certification with using our products. Today the Observability-Self-Hosted-Fundamentals exam software provided by our Test4Sure has been tested by more and more candidates, which has helped them get the Observability-Self-Hosted-Fundamentals exam certification. You can download our free demo after you enter the homepage of our website. We hope that you can recognize our product. Once there is any update of Observability-Self-Hosted-Fundamentals Exam software coming out after you purchased, we will immediately inform you, and make you ease to prepare for the exam.

Observability-Self-Hosted-Fundamentals Test Pattern - Observability-Self-Hosted-Fundamentals Materials

Our Observability-Self-Hosted-Fundamentals preparation exam is compiled specially for it with all contents like exam questions and answers from the real Observability-Self-Hosted-Fundamentals exam. If you make up your mind of our Observability-Self-Hosted-Fundamentals exam prep, we will serve many benefits like failing the first time attached with full refund service, protecting your interests against any kinds of loss. In a word, you have nothing to worry about with our Observability-Self-Hosted-Fundamentals Study Guide.

SolarWinds Observability Self-Hosted Fundamentals Sample Questions (Q11-Q16):

NEW QUESTION # 11

Which two of the following export formats are supported in Hybrid Cloud Observability (HCO) reports?
(Choose two.)

- A. excel
- B. txt
- C. PDF
- D. JSON

Answer: A,C

Explanation:

SolarWinds Hybrid Cloud Observability provides robust reporting capabilities designed for both technical analysis and executive presentation. The SolarWinds Platform Reporting Guide specifies that reports generated through the Web Console can be delivered or manually exported in several standardized formats.

* Excel (.xls/.xlsx): This format is primarily used for data-heavy reports where administrators need to perform further calculations, sorting, or external data manipulation. It allows the raw table data from the report to be easily ingested into other business intelligence tools.

* PDF: This is the standard format for automated delivery and "executive-ready" documentation. It preserves the visual layout, including charts, logos, and specific formatting defined in the report builder.

While the platform uses JSON (Option B) for internal API communications and some dashboard configurations, and txt (Option D) might be used for certain log exports, they are not standard selectable

"export formats" within the primary Web-Based Report builder for end-user consumption. The primary focus of the reporting engine is providing human-readable (PDF) and spreadsheet-compatible (Excel) outputs.

NEW QUESTION # 12

Which two of the following conclusions can be made from the shown AppStack view? (Choose two.)

- A. The user's account is given administrator access rights.
- B. The storage resource monitor (SRM) is not installed.
- C. A filter is applied to show entities related to an application.
- D. The option to hide categories with no objects is selected.

Answer: C,D

Explanation:

According to the SolarWinds Platform Administrator Guide for Hybrid Cloud Observability, the AppStack Environment View provides an interactive, visual mapping of relationships between monitored entities such as applications, servers, and storage. In the provided image, it is evident that a filter is applied to show entities related to an application (A) because the left-hand navigation pane shows specific filters selected under the "Applications" category, and the main view displays a subset of the environment's total objects that correspond specifically to those application relationships. This filtering capability allows users to narrow down the environment to focus on the specific dependencies of a critical business service, such as Microsoft Active Directory or a SQL Server instance, which are shown as filtered groups in the sidebar.

Furthermore, it can be concluded that the option to hide categories with no objects is selected (B). A standard, unfiltered AppStack view typically displays every possible layer of the IT stack—including Transactions, LUNs, Pools, and Arrays—regardless of whether they contain active entities. However, in the provided view, only categories containing entities relevant to the current filter (such as Applications, Database Instances, Servers, and Volumes) are visible. This indicates that the "Hide categories with no objects" setting is active, which is a standard customization used to clean up the interface and highlight only the active parts of the dependency map. While the view shows storage-related entities like "Volumes," this does not confirm whether the Storage Resource Monitor (SRM) is not installed (C), as basic volume data can often be collected via standard node polling. Additionally, the AppStack interface itself does not provide enough diagnostic data to verify if the user account is given administrator access rights (D), as these visual elements are accessible to non-admin users with appropriate view permissions. Therefore, A and B are the only verified conclusions based on the visual evidence of the filtered environment.

NEW QUESTION # 13

A user account has been granted administrator rights in the web console. By default, which area is disabled for the user (i.e., unable to add, edit, schedule, or delete)?

- A. passwords
- B. alerts
- C. reports
- D. dashboards

Answer: A

Explanation:

In the SolarWinds Platform, "Administrator" rights in the Web Console grant extensive control over monitoring configurations, but they are distinct from "System Administrator" or "Security Administrator" roles. According to the SolarWinds Platform User Account Management guide, a Web Console Administrator can manage nodes, create alerts, build reports, and customize dashboards. However, for security reasons, the ability to manage passwords—specifically the credentials used for polling (SNMP strings, WMI service accounts, or external integration secrets)—is often restricted. While an admin can assign an existing credential to a node, the ability to add, edit, or view the clear-text/obfuscated passwords within the centralized Credential Library is a separate, higher-level security permission. This prevents a standard Web Administrator from potentially harvesting sensitive service account passwords from the database. This "separation of duties" ensures that while a user can manage the monitoring environment, they cannot necessarily compromise the security of the underlying infrastructure accounts.

NEW QUESTION # 14

An agent software has been deployed to the Windows domain controller, however the server is being polled through WMI. What is causing this irregularity?

- A. edit the node and change the polling method
- B. agent polling is not supported
- C. agent did not install correctly
- D. configure polling engine to accept agent data

Answer: A

Explanation:

In the SolarWinds Platform, the method used to poll a node (SNMP, WMI, or Agent) is a specific property assigned to the node record in the database. According to the SolarWinds Platform Agent Management guide, simply installing the agent software on a remote server does not automatically convert the existing node record to use that agent for data collection. If a node was originally added to the system via WMI, the platform will continue to attempt to poll it via WMI over the network using RPC/DCOM, even if the SolarWinds Agent is successfully installed and running on the target machine. To fix this "irregularity" and take advantage of the agent's encrypted, single-port communication, an administrator must edit the node and change the polling method (D).

By going to Manage Nodes, selecting the domain controller, and clicking "Edit Properties," the admin must find the "Polling Method" section and select "Agent". Once saved, the Polling Engine will stop using WMI network calls and will instead wait for the agent to provide the data (if in Agent-Initiated mode) or reach out to the agent via the agent's port (if in Server-Initiated mode). This change ensures that the monitoring load is shifted to the agent and that the communication adheres to the desired security profile.

NEW QUESTION # 15

A web console user reported they are unable to view reports within the web console. What is a possible cause for this issue?

- A. user is prevented from viewing all monitored entities
- B. user is prevented from viewing all reports
- C. user is prevented from viewing all limitations
- D. user is prevented from viewing all predefined reports

Answer: B

Explanation:

Visibility of the reporting module is a configurable security setting within each SolarWinds user account. According to the SolarWinds Platform User Account Management guide, if a user logs into the Web Console and finds the Reports section empty or inaccessible, it is likely due to an Account Limitation.

Specifically, the "Report Limitation" field in the user's profile can be set to "No Reports". This setting acts as a total block, preventing the user from viewing any report definitions, whether they are predefined (out-of-the-box) or custom-made. This is a common configuration for restricted user roles, such as basic operators or external contractors, who need to see real-time status in dashboards but should not have access to the historical, inventory, or security data contained in the platform's reporting engine. While a user could also be restricted from seeing specific entities (Option B), this would typically just result in empty data inside a report rather than the total inability to view the reports module itself. Setting the account to "No Reports" ensures the user is prevented from viewing all reports globally across the platform.

NEW QUESTION # 16

.....

Test4Sure provides updated and valid SolarWinds Exam Questions because we are aware of the absolute importance of updates, keeping in mind the dynamic SolarWinds Observability Self-Hosted Fundamentals exam syllabus. We provide you update checks for 1 year after purchase for absolutely no cost. We also give a 30% discount on all SolarWinds Observability-Self-Hosted-Fundamentals Dumps.
