During the "initiate" phase, what are two key benefits of successful requirements gathering?

- A. Fewer test cases required
- B. Better performance of the application
- C. Less rework after the "test" phase
- D. Adherence to the business stakeholders' goals

Answer: C,D

Explanation:
Adherence to the Business Stakeholders' Goals (A): Successful requirements gathering ensures that the application being developed aligns with the business objectives and stakeholders' expectations. This alignment is critical to delivering a product that meets the intended purpose and satisfies the needs of the organization.Appian Documentation - Requirements Gathering Best Practices Less Rework After the "Test" Phase (B): Thorough and accurate requirements gathering reduces the likelihood of discovering significant issues during the testing phase. When the requirements are well-defined and understood from the start, the development team is more likely to build the application correctly the first time, resulting in less rework after testing.Appian Documentation - Reducing Rework through Proper Planning Note: Fewer test cases required (C) and better performance of the application (D) are not direct benefits of successful requirements gathering. While better requirements can contribute to a more streamlined testing process and potentially better performance, these are not primary benefits.

Referring to the UX Design Guide helps in making informed design decisions that enhance user experience.Appian UX Design Guide Note: While other resources like Appian Tutorials, Discussion Boards, and SAIL Recipes are useful for specific cases, the UX Design Guide is the primary reference for best practices in UI design.

- D. Automating business processes with complex workflow
- E. Building highly-interactive reporting or data exploration applications

NEW QUESTION # 32

What are two benefits of creating future state process models (or process models-to-be)?

- A. They capture integration definitions, showcasing necessary automation details.
- B. They capture Robotic Process Automation (RPA) intervention specifics from Appian.
- C. They can help identify opportunities where Appian features can bring in automation.
- D. They can capture high-level product vision and goals.

Answer: C,D

Explanation:
Creating future state process models (or process models-to-be) has several benefits, including capturing the high-level product vision and identifying areas where Appian's features can introduce automation.
Capturing High-Level Product Vision and Goals (C):
Future state process models help in visualizing the desired end state of a process.
They provide a clear picture of how the process should function once all enhancements and improvements have been implemented.
This clarity aligns stakeholders around a common goal and ensures that development efforts are focused on delivering the desired outcomes.
Identifying Automation Opportunities (D):
By modeling the future state, teams can spot manual tasks and inefficiencies that could be automated using Appian's features like process modeling, smart services, and RPA.
This identification helps in streamlining processes and improving overall efficiency.
Why Not Other Options?:
A . RPA intervention specifics: While important, RPA specifics are typically captured during the detailed design phase rather than in high-level future state process models.
B . Integration definitions: These are technical details that are generally documented separately from high-level process models.

NEW QUESTION # 33

The HR management team wants to aggregate data to show the number of employees across regions and to be able to drill down into the data.
Which three user story requirements should be collected to assist the development team?

- A. Estimation of story
- B. Test script
- C. Report type
- D. Data source
- E. Role-based permissions

Answer: C,D,E

Explanation:
Data Source (A): The first step in building any report is identifying the source of the data. Understanding where the data comes from is crucial because it affects how the data will be queried, filtered, and displayed. It also impacts performance, security, and accuracy of the data. Appian reports can pull data from various sources such as Appian databases, external databases, or even from integrations with other systems. Documenting this information allows the development team to connect the report to the correct data source, ensuring that the report reflects accurate and up-to-date information.Appian Documentation - Data Sources
Report Type (B): It is essential to define the type of report required. In this scenario, the HR management team wants an aggregate view with drill-down capabilities. The report type will determine how the data is visualized, whether it is a pie chart, bar graph, or tabular format. This user story requirement ensures that the developers design a report that meets the HR team's needs and

expectations for viewing and interacting with the data. Appian Documentation - Creating Reports

Role-Based Permissions (D): Role-based permissions are critical for ensuring that users see only the data they are authorized to access. For instance, while an HR executive might have access to all regions' data, a regional manager might only see data for their specific region. Defining these permissions upfront is vital for security and compliance. The development team will use this information to implement the correct access controls in the report, which is crucial for protecting sensitive employee information.
