Pass Guaranteed Quiz 2026 Amazon Updated AWS-Solutions-Associate: AWS Certified Solutions Architect - Associate (SAA-C03) Exam Tutorial

The trick to the success is simply to be organized, efficient, and to stay positive about it. If you are remain an optimistic mind all the time when you are preparing for the AWS-Solutions-Associate exam, we deeply believe that it will be very easy for you to successfully pass the exam, and get the related certification in the near future. Of course, we also know that how to keep an optimistic mind is a question that is very difficult for a lot of people to answer. Because the AWS-Solutions-Associate Exam is so difficult for a lot of people that many people have a failure to pass the exam.

Amazon Web Services (AWS) Certified Solutions Architect - Associate (SAA-C02) certification is a widely recognized and respected credential in the cloud computing industry. AWS Certified Solutions Architect - Associate (SAA-C03) certification is designed for individuals who want to demonstrate their expertise in designing, deploying, and operating scalable and reliable systems on AWS.

To prepare for the AWS SAA-C02 exam, candidates can take advantage of various resources available online, such as AWS documentation, whitepapers, and online courses. AWS also offers official training courses for individuals who want to prepare for the exam. The AWS Certified Solutions Architect - Associate certification is an excellent way for individuals to demonstrate their expertise in designing and deploying scalable and highly available systems on AWS. Passing AWS-Solutions-Associate Exam can open up new opportunities for professionals in the cloud computing industry and can lead to better career prospects.

To keep pace with the times, we believe science and technology can enhance the way people study on our AWS-Solutions-Associate exam materials. Especially in such a fast-pace living tempo, we attach great importance to high-efficient learning our AWS-Solutions-Associate Study Guide. Therefore, our AWS-Solutions-Associate study materials base on the past exam papers and the current exam tendency, and design such an effective simulation function to place you in the real exam environment.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q401-Q406):

NEW QUESTION # 401
A company built a food ordering application that captures user data and stores it for future analysis. The application's static front end is deployed on an Amazon EC? instance. The front-end application sends the requests to the backend application running on separate EC2 instance. The backend application then stores the data in Amazon RDS.
What should a solutions architect do to decouple the architecture and make it scalable?

- A. Use Amazon S3 to serve the static front-end application and send requests lo Amazon API Gateway which writes the requests to an Amazon SQS queue Place the backend instances in an Auto Scaling group, and scale based on the queue depth to process and store the data in Amazon RDS
- B. Use Amazon S3 to serve the front-end application and write requests to an Amazon Simple Notification Service (Amazon SNS) topic. Subscribe Amazon EC2 instances to the HTTP/HTTPS endpoint o(the topic, and process and store the data in

Amazon RDS
- C. Use Amazon S3 to serve the front-end application, which sends requests to Amazon EC2 to execute the backend application. The backend application will process and store the data in Amazon RDS
- D. Use an EC2 instance lo serve the front end and write requests to an Amazon SOS queue Place the backend Instance in an Auto Scaling group, and scale based on the queue depth to process and store the data in Amazon RDS.

Answer: A

NEW QUESTION # 402
A company needs to provide customers with secure access to its data. The company processes customer data and stores the results in an Amazon S3 bucket.
All the data is subject to strong regulations and security requirements. The data must be encrypted at rest.
Each customer must be able to access only their data from their AWS account. Company employees must not be able to access the data.
Which solution will meet these requirements?

- A. Provision a separate AWS Key Management Service (AWS KMS) key for each customer. Encrypt the data server-side. In the S3 bucket policy, deny decryption of data for all principals except an IAM role that the customer provides.
- B. Provision an AWS Certificate Manager (ACM) certificate for each customer. Encrypt the data client- side. In the private certificate policy, deny access to the certificate for all principals except an IAM role that the customer provides.
- C. Provision an AWS Certificate Manager (ACM) certificate for each customer. Encrypt the data client- side. In the public certificate policy, deny access to the certificate for all principals except an IAM role that the customer provides.
- D. Provision a separate AWS Key Management Service (AWS KMS) key for each customer. Encrypt the data server-side. In each KMS key policy, deny decryption of data for all principals except an IAM role that the customer provides.

Answer: D

Explanation:
The correct solution is to provision a separate AWS KMS key for each customer and encrypt the data server- side. This way, the company can use the S3 encryption feature to protect the data at rest and delegate the control of the encryption keys to the customers. The customers can then use their own IAM roles to access and decrypt their data. The company employees will not be able to access the data because they are not authorized by the KMS key policies. The other options are incorrect because:
Option A and D are using ACM certificates to encrypt the data client-side. This is not a recommended practice for S3 encryption because it adds complexity and overhead to the encryption process. Moreover, the company will have to manage the certificates and their policies for each customer, which is not scalable and secure.
Option B is using a separate KMS key for each customer, but it is using the S3 bucket policy to control the decryption access. This is not a secure solution because the bucket policy applies to the entire bucket, not to individual objects. Therefore, the customers will be able to access and decrypt each other's data if they have the permission to list the bucket contents. The bucket policy also overrides the KMS key policy, which means the company employees can access the data if they have the permission to use the KMS key.

ACM certificates

NEW QUESTION # 403
The financial application at a company stores monthly reports in an Amazon S3 bucket. The vice president of finance has mandated that all access to these reports be logged and that any modifications to the log files be detected.
Which actions can a solutions architect take to meet these requirements?

- A. Use AWS CloudTrail to create a new trail. Configure the trail to log read and write management events on the S3 bucket that houses the reports. Log these events to a new bucket, and enable log file validation.
- B. Use AWS CloudTrail to create a new trail. Configure the trail to log read and write data events on the S3 bucket that houses the reports. Log these events to a new bucket, and enable log file validation.
- C. Use S3 server access logging on the bucket that houses the reports with the read and write data events and log file validation options enabled.
- D. Use S3 server access logging on the bucket that houses the reports with the read and write management events and log file validation options enabled.

Answer: B

NEW QUESTION # 404

A Solutions Architect is creating an application running in an Amazon VPC that needs to access AWS Systems Manager Parameter Store Network security rules prohibit any route table entry with a 0.0.0.0/0 destination.
What infrastructure addition will allow access to the AWS service while meeting the requirements?

- A. NAT gateway
- B. AWS Private Link
- C. NAT instance
- D. VPC peering

Answer: B

NEW QUESTION # 405

A user has created a VPC with public and private subnets using the VPC Wizard. The VPC has CIDR
20.0.0.0/16. The private subnet uses CIDR 20.0.0.0/24.
Which of the below mentioned entries are required in the main route table to allow the instances in VPC to communicate with each other?

- A. Destination : 20.0.0.0/24 and Target : Local
- B. Destination : 20.0.0.0/16 and Target : ALL
- C. Destination : 20.0.0.0/16 and Target : Local
- D. Destination : 20.0.0.0/0 and Target : ALL

Answer: C

Explanation:
A user can create a subnet with VPC and launch instances inside that subnet. If the user has created a public private subnet, the instances in the public subnet can receive inbound traffic directly from the Internet, whereas the instances in the private subnet cannot. If these subnets are created with Wizard, AWS will create two route tables and attach to the subnets. The main route table will have the entry
"Destination: 20.0.0.0/16 and Target: Local", which allows all instances in the VPC to communicate with each other.
