

# **C\_BW4H\_2505 Latest Exam Practice, C\_BW4H\_2505 Reliable Exam Practice**

P.S. Free 2026 SAP C\_BW4H\_2505 dumps are available on Google Drive shared by TestInsides: <https://drive.google.com/open?id=1WM9IBShwE5ieWYwxUVwDKw5nTzJFZw1>

We offer you free update for one year for C\_BW4H\_2505 study guide, namely, in the following year, you can obtain the latest version for free. And the latest version for C\_BW4H\_2505 exam dumps will be sent to your email automatically. In addition, C\_BW4H\_2505 exam materials are high quality, since we have experienced experts to compile and verify them, therefore the quality and accuracy can be guaranteed, so you can use them at ease. We have online and offline chat service, and if you have any questions about C\_BW4H\_2505 Exam Dumps, you can consult us, and we will give you reply as quickly as possible.

## **SAP C\_BW4H\_2505 Exam Syllabus Topics:**

<b>Topic</b>	<b>Details</b>
Topic 1	<ul style="list-style-type: none"><li>• Data Acquisition into SAP HANA: This section evaluates the capacity of SAP Consultants to integrate various data sources into SAP HANA. It assesses their ability to understand different ingestion techniques and ensure data accessibility for processing.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• SAP BW</li><li>• 4HANA Project and the Modeling Process: This section of the exam assesses how Data Engineers guide and contribute to SAP BW</li><li>• 4HANA projects. It includes knowledge of modeling workflows, project lifecycle stages, and collaboration strategies within project teams.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>• Fundamentals: This section of the exam measures the foundational understanding of SAP Consultants and covers essential terms and concepts related to SAP BW</li><li>• 4HANA and SAP Business Data Cloud. It focuses on the core framework and architecture necessary to navigate and work with these platforms.</li></ul>

Topic 4	<ul style="list-style-type: none"> <li>• Data Acquisition into SAP BW</li> <li>• 4HANA: This section tests how Data Engineers manage data integration into SAP BW</li> <li>• 4HANA from multiple sources. It covers essential knowledge of tools and processes used for data extraction, transformation, and loading into the SAP environment.</li> </ul>
Topic 5	<ul style="list-style-type: none"> <li>• InfoObjects and InfoProviders: This section tests the knowledge of Data Engineers in working with InfoObjects and InfoProviders in SAP BW</li> <li>• 4HANA. It involves handling data structures used for organizing, storing, and accessing analytical data.</li> </ul>
Topic 6	<ul style="list-style-type: none"> <li>• SAP BW Query Design: This section of the exam assesses the ability of Data Engineers to create and run queries using SAP BW</li> <li>• 4HANA. It evaluates how well candidates can work with query components to retrieve and structure data effectively for reporting and analysis.</li> </ul>

## **C\_BW4H\_2505 Reliable Exam Practice | C\_BW4H\_2505 Instant Download**

Our company employs a professional service team which traces and records the popular trend among the industry and the latest update of the knowledge about the C\_BW4H\_2505 exam reference. We give priority to keeping pace with the times and providing the advanced views to the clients. We keep a close watch at the most advanced social views about the knowledge of the test C\_BW4H\_2505 Certification. Our experts will renovate the test bank with the latest C\_BW4H\_2505 exam practice question and compile the latest knowledge and information into the C\_BW4H\_2505 exam questions and answers.

### **SAP Certified Associate - Data Engineer - SAP BW/4HANA Sample Questions (Q54-Q59):**

#### **NEW QUESTION # 54**

What are some of the benefits of using an InfoSource in a data flow? Note: There are 2 correct answers to this question.

- A. Enabling a data transfer process (DTP) to process multiple sequential transformations
- B. Realizing direct access to source data without storing them
- C. Splitting a complex transformation into simple parts without storing intermediate data
- D. Providing the delta extraction information of the source data

**Answer: A,C**

Explanation:

An InfoSource in SAP BW/4HANA is a logical object used in data flows to facilitate the movement and transformation of data between source systems and target objects (e.g., DataStore Objects, InfoCubes). Let's analyze each option to determine why A and C are correct:

\* Explanation: An InfoSource allows you to break down a complex transformation into smaller, manageable steps. This modular approach simplifies the design and maintenance of data flows.

Importantly, the intermediate results are not stored permanently, which optimizes storage usage and improves performance.

\* In SAP BW/4HANA, InfoSources act as intermediate layers that streamline data processing by enabling step- by-step transformations without creating additional persistent storage layers.

2. Providing the delta extraction information of the source data (Option B)Explanation: Delta extraction is typically handled by the source system or the Data Transfer Process (DTP), not by the InfoSource itself.

The InfoSource is primarily a logical container for organizing and transforming data, not for managing delta mechanisms.

Reference: Delta handling is configured at the source system or extractor level and is managed through DTP settings. The InfoSource does not play a direct role in this process.

3. Enabling a data transfer process (DTP) to process multiple sequential transformations (Option C)Explanation: An InfoSource can be used to chain multiple transformations together, allowing a single DTP to process these transformations sequentially. This capability enhances the flexibility and efficiency of data flows by consolidating multiple steps into a single process.

Reference: In SAP BW/4HANA, InfoSources serve as intermediaries that enable seamless integration of multiple transformations within a single DTP, reducing complexity and improving performance.

4. Realizing direct access to source data without storing them (Option D)Explanation: Direct access to source data without storage is

achieved through Virtual Providers or other real-time data access mechanisms, not through InfoSources. InfoSources are designed to temporarily hold transformed data during the data flow process.

Reference: Virtual Providers bypass the need for physical storage by directly accessing source data.

InfoSources, on the other hand, are part of the physical data flow architecture and involve temporary storage of transformed data. ConclusionThe correct answers areA (Splitting a complex transformation into simple parts without storing intermediate data)andC (Enabling a data transfer process (DTP) to process multiple sequential transformations). These benefits highlight the flexibility and efficiency that InfoSources bring to data modeling and transformation processes in SAP BW/4HANA.

## NEW QUESTION # 55

You create a Data Store object (advanced) using the "Data Mart DataStore Object" modeling property. Which behaviors are specific to this modeling property? Note: There are 2 correct answers to this question.

- A. The records are treated as if all characteristics are in the key.
- **B. Query results are shown only when data has been activated.**
- C. The change log table will be filled only after data activation.
- **D. Reporting is done based on a union of the inbound active tables.**

**Answer: B,D**

Explanation:

When creating a Data Store object (advanced) in SAP BW/4HANA, selecting the "Data Mart DataStore Object" modeling property defines specific behaviors tailored for reporting and analytics. This type of DataStore object is optimized for use as a data mart, meaning it is designed to store aggregated or cleansed data that is ready for consumption by reporting tools.

\* Query Results Are Shown Only When Data Has Been Activated (B): In a Data Mart DataStore Object, data must be explicitly activated before it becomes available for reporting. This ensures that only consistent and validated data is exposed to end users.

During the activation process:

\* Data is moved from the inbound table to the active table.  
\* Any errors or inconsistencies are resolved before the data is made available for querying.  
\* Queries executed against the DataStore object will only display results from the active table, ensuring reliable and accurate reporting.  
\* Reporting Is Done Based on a Union of the Inbound Active Tables (C): A Data Mart DataStore Object supports multiple inbound tables, which can be used to store data from different sources or partitions. For reporting purposes, the system performs a union of these inbound active tables to provide a consolidated view of the data. This behavior is particularly useful when integrating data from multiple sources into a single reporting layer.

Behaviors Specific to the "Data Mart DataStore Object" Modeling Property:

\* A. The Change Log Table Will Be Filled Only After Data Activation: This statement is incorrect because the change log table is not a feature of the Data Mart DataStore Object. Change logs are typically associated with Staging and Reporting DataStore Objects (Stard) or other types of DataStore objects that track detailed changes. In contrast, a Data Mart DataStore Object focuses on providing aggregated and cleansed data for reporting, without maintaining a detailed change history.

\* D. The Records Are Treated as If All Characteristics Are in the Key: This statement is also incorrect. In a Data Mart DataStore Object, records are not treated as if all characteristics are part of the key. Instead, the key structure is explicitly defined during the modeling process, and only the specified key fields are used to identify unique records. Treating all characteristics as part of the key is a behavior associated with other types of DataStore objects, such as those used for staging or operational reporting.

Incorrect Options:

SAP Data Engineer - Data Fabric Context: In the context of SAP Data Engineer - Data Fabric, understanding the behavior of different DataStore object types is essential for designing efficient and scalable data models. The Data Mart DataStore Object is specifically designed for reporting and analytics, making it a key component of the data fabric architecture. By ensuring that query results are only shown after activation and leveraging a union of inbound active tables, this modeling property supports reliable and consistent reporting across the organization.

For further details, refer to:

\* SAP BW/4HANA Data Modeling Guide: Explains the differences between DataStore object types and their specific behaviors.  
\* SAP Learning Hub: Offers training on designing and implementing DataStore objects in SAP BW/4HANA.

By selecting B (Query results are shown only when data has been activated) and C (Reporting is done based on a union of the inbound active tables), you ensure that the correct behaviors specific to the "Data Mart DataStore Object" modeling property are identified.

## NEW QUESTION # 56

How can the delta merge process be initiated in SAP BW/4HANA? Note: There are 2 correct answers to this question.

- A. By setting a specific flag in the data transfer process
- B. By using a specific process type in a process chain
- C. By using the SAP BW/4HANA data load monitor
- D. By setting a specific flag in the transformation

**Answer: A,B**

#### NEW QUESTION # 57

Which development object needs to be built to generate an HDI Container?

- A. HDB module
- B. Package
- C. Space
- D. SQL script procedure

**Answer: A**

Explanation:

In the context of SAP HANA Deployment Infrastructure (HDI), an HDI Container is a dedicated, isolated schema in the SAP HANA database that stores and manages database objects such as tables, views, procedures, and other artifacts. HDI Containers are used to support multi-target applications (MTAs) and enable developers to manage database objects in a structured and modular way.

\* **HDB Module (B):** An HDB module is a development object within the SAP Web IDE for SAP HANA or SAP Business Application Studio. It contains the database design-time artifacts (e.g., `hdbtable`, `hdbview`, `hdbsynonym`) that define the structure and logic of the database objects. When you build an HDB module, it triggers the creation of an HDI Container if one does not already exist. The HDI Container is then populated with the runtime objects generated from the design-time artifacts defined in the HDB module.

\* **Key Points:**

\* The HDB module is part of a Multi-Target Application (MTA) project.

\* It uses the HDI Deployer service to deploy the design-time artifacts into the HDI Container.

\* The HDI Container ensures isolation and versioning of database objects, making it suitable for modern application development practices.

\* **Why Not the Other Options?**

\* **Space (A):** A space is a concept in Cloud Foundry environments where applications and services are deployed. While spaces are used to organize and isolate resources, they are not directly related to generating an HDI Container. Spaces host applications and services but do not define the database objects required for an HDI Container.

\* **Package (C):** In SAP HANA, a package is a folder-like structure used to organize development objects in the SAP HANA repository. However, packages alone do not generate HDI Containers.

They are used in the classic repository-based development model (XSA or XS Classic), whereas HDI Containers are associated with the newer HDI-based development model.

\* **SQL Script Procedure (D):** A SQL script procedure is a database artifact used to define procedural logic in SQL. While SQL script procedures can be deployed into an HDI Container, they are not responsible for generating the container itself. The container must already exist before deploying such artifacts.

**Development Object Required to Generate an HDI Container:**

**SAP Data Engineer - Data Fabric Context:** In the SAP Data Engineer - Data Fabric landscape, HDI Containers play a crucial role in enabling modular and scalable data management. They allow developers to create isolated environments for different applications or tenants, ensuring data security and consistency. By leveraging HDB modules, developers can define and deploy database objects in a structured manner, aligning with modern DevOps practices.

For more information, refer to the following resources:

\* **SAP HANA Developer Guide for SAP HANA XS Advanced:** Explains the role of HDB modules and HDI Containers in application development.

\* **SAP Business Application Studio Documentation:** Provides guidance on creating and building HDB modules in the context of MTAs.

\* **SAP Learning Hub:** Offers training on SAP HANA development, including HDI and MTA concepts.

By selecting B (HDB module), you ensure that the correct development object is identified for generating an HDI Container, enabling efficient database development and deployment.

## NEW QUESTION # 58

What are the prerequisites for deleting business partner attribute master data in SAP BW/4HANA? Note:

There are 2 correct answers to this question.

- A. There must be no transaction data in a DataStore Object (advanced) referring to business partner values that should be deleted.
- B. In SAP BW/4HANA there must be no hierarchy data related to business partner values that should be deleted.
- C. There must be no BW query as InfoProvider in SAP BW/4HANA that uses business partner as a free characteristic.
- D. In SAP BW/4HANA there must be no analysis authorizations related to business partner values that should be deleted

**Answer: A,B**

## NEW QUESTION # 59

.....

Among all marketers who actively compete to win customers, we sincerely offer help for exam candidates like you with our C\_BW4H\_2505 exam questions. To cater to the needs of exam candidates, our experts have been assiduously worked for their quality day and night. C\_BW4H\_2505 Training Materials can help you achieve personal goals about the C\_BW4H\_2505 exam successfully. So of course we received sincere feed-backs from exam candidates which are maximum benefits for us.
