Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q24-Q29):

NEW QUESTION # 24

You want to take advantage of Azure availability zones for your cloud-based Fortinet deployment.

Which two benefits do Azure availability zones provide? (Choose two.)

- A. Improve database performance and reliability
- B. Protect applications and data across multiple Azure regions
- C. Enhanced protection for application and data in a single Azure region
- D. Protect applications and data through high availability with fault isolation and redundancy

Answer: C,D

Explanation:

Enhanced protection for application and data in a single Azure region - Availability Zones provide physical separation of infrastructure within a single Azure region, protecting against datacenter-level failures.

Protect applications and data through high availability with fault isolation and redundancy - They offer fault isolation and redundancy, enabling high availability for applications and services by distributing them across multiple zones within the same region.

NEW QUESTION # 25

Refer to the exhibits.

FGT connector settings

FortiGate Azure Connector settings:

- Server region: Global
- Use managed identity: ☐
- Directory ID: 60b93279-efda-45f5-9c1d-e7f999c1
- Application ID: e7ac2b2f-25b1-4e66-96b4-9dbc90e
- Client secret: (This field is required.)
- Resource path: ☒
- Subscription ID: 9a359c2e-e035-4d1e-ba17-0b600cb2
- Resource group: SxLab

Application registration key

Client secrets

A secret string that the application uses to prove its identity when requesting a token. Also can be referred to as application password.

+ New client secret

Description	Expires	Value	ID
FortGateKey	12/31/2299	application secret	

You are configuring an SDN connector for Azure on a FortiGate device. You completed all the required steps on the Azure side. While configuring the FortiGate side, you notice that you did not save the client secret used in the Azure App Registration. What is the quickest way to obtain the value of the client secret?

- A. Create a new external connector for Azure
- B. Create a new app registration
- C. Create a new client secret
- D. Create a new resource group

Answer: C

Explanation:

Azure does not allow you to view an existing client secret's value after creation for security reasons. If you did not save the client secret when it was first generated, the quickest and only option is to create a new client secret under the existing app registration and use the new value in your FortiGate configuration.

NEW QUESTION # 26

After integrating a FortiGate VM with Azure Route Server, you detect that routes are not propagating successfully. What initial step could you perform to diagnose the root cause?

- **A. Verify the BGP peering status on both the FortiGate VM and Azure Route Server**
- B. Examine the Azure Microsoft Entra ID permissions associated with the FortiGate VM to ensure that correct authentication is being used for BGP peering
- C. Monitor the network latency between the FortiGate VM and Azure Route Server to identify potential communication delays affecting route propagation
- D. Verify that the FortiGate VM is running the latest firmware version

Answer: A

Explanation:

The first and most direct diagnostic step is to verify the BGP peering status on both the FortiGate VM and Azure Route Server. If BGP peering is not established or is in an idle or down state, route propagation will fail. This check confirms whether the two systems are communicating and exchanging routes as expected.

NEW QUESTION # 27

What are two characteristics of Azure standard public IP addresses? (Choose two.)

- **A. They support the use of availability zones**
- **B. They can be dynamic or static**
- C. They require the configuration of NSGs for inbound traffic
- D. They can be used with load balancers of any SKU

Answer: A,B

Explanation:

They support the use of availability zones - Standard public IP addresses are zone-redundant and support availability zone deployments for high availability.

They can be dynamic or static - Azure standard public IPs can be configured as static or dynamic, offering flexibility based on deployment needs.

NEW QUESTION # 28

What is a key distinction between Azure Firewall and FortiGate VM in terms of their primary functions?

- A. Azure Firewall focuses on network traffic inspection, while FortiGate VM is primarily a web application firewall.
- B. Azure Firewall is designed exclusively for application layer filtering, while FortiGate VM is suitable for both on-premises and cloud environments.
- **C. Azure Firewall is a cloud-native network security service, while FortiGate VM is a network virtual appliance (NVA) that provides comprehensive security functions.**
- D. Azure Firewall and FortiGate VM have identical primary functions, and no features differentiation.

Answer: C

Explanation:

Azure Firewall is a cloud-native, fully managed network security service designed to control and log network traffic using Azure policies. In contrast, the FortiGate VM is a network virtual appliance (NVA) that delivers comprehensive security features, including firewalling, IPS, antivirus, VPN, and application control, suitable for both on-premises and cloud deployments.
