## Fortinet NSE 6 - FortiSwitch 7.2 Sample Questions (Q20-Q25):

### NEW QUESTION # 20

How is traffic routed on FortiSwitch?

- A. Hardware-based routing on FortiSwitch is handled by the CPU.
- **B. FortiSwitch looks up the hardware routing table and then the forwarding information base (FIB).**
- C. Layer 3 routing can be configured on FortiSwitch, while managed by FortiGate.
- D. ASIC hardware routing can only handle dynamic routing, if supported.

**Answer: B**

### NEW QUESTION # 21

How does FortiSwitch perform actions on ingress and egress traffic using the access control list (ACL)?

- A. ACL can be used only at the prelookup stage in the traffic processing pipeline.
- B. Only high-end FortiSwitch models support ACL.
- C. Classifiers enable matching traffic based only on the VLAN ID.
- **D. FortiSwitch checks ACL policies only from top to bottom.**

**Answer: D**

Explanation:

In FortiSwitch, Access Control Lists (ACLs) are used to enforce security rules on both ingress and egress traffic:

ACL Evaluation Order (D):

Operational Function: FortiSwitch processes ACL entries from top to bottom, similar to how firewall rules are processed. The first match in the ACL determines the action taken on the packet, whether to allow or deny it, making the order of rules critical.

Configuration Advice: Careful planning of the order of ACL rules is necessary to ensure that more specific rules precede more general ones to avoid unintentional access or blocks.

### NEW QUESTION # 22

What can an administrator do to maintain a FortiGate-compatible FortiSwitch configuration when changing the management mode from standalone to FortiLink?

- A. Use a migration tool based on Python script to convert the configuration.
- B. Register FortiSwitch to FortiSwitch Cloud to save a copy before managing with FortiGate.
- **C. FortiGate automatically saves the existing FortiSwitch configuration during the FortiLink management process.**
- D. Enable the FortiLink setting on FortiSwitch before the authorization process.

**Answer: C**

Explanation:

When transitioning the management of a FortiSwitch from standalone mode to being managed by FortiGate via FortiLink, it is critical to ensure that the existing configurations are preserved. The best practice involves:

FortiGate's Role in Configuration Preservation:

FortiGate has the capability to automatically preserve the existing configuration of a FortiSwitch when it is integrated into the network via FortiLink. This feature helps ensure that the transition does not disrupt the network's operational settings.

Configuration Integration:

As FortiSwitch is integrated into FortiGate's management via FortiLink, FortiGate captures and integrates the existing switch configuration, enabling a seamless transition. This process involves FortiGate recognizing the FortiSwitch and its current setup, then incorporating these settings into the centralized management interface without the need for manual reconfiguration or the use of additional tools.

- B. Loop guard frame sourced from port 1 was received on port 1.
- C. STP triggered a loop and applied loop guard protection on port1.
- D. An endpoint sent a BPDU on port1 that it received from another interface.

Answer: A,C

Explanation:

When loop guard is enabled on port1 and port2 configured with the same native VLAN (VLAN 10), there are specific scenarios under which port1 can be shut down due to loop guard operation:

A . port1 was shut down by loop guard protection. Loop guard is a specific feature used in network environments to prevent alternative or redundant loops. When loop guard is active, it can shut down a port if it stops receiving BPDU (Bridge Protocol Data Units) on a port that is expected to receive them, assuming a loop or link failure and putting the port into an inconsistent state to prevent potential loops.

B . STP triggered a loop and applied loop guard protection on port1. If the Spanning Tree Protocol (STP) detects a loop or loss of BPDU transmissions while loop guard is enabled, it will proactively shut down the port to prevent network instability or a broadcast storm. This is an essential function of loop guard within the context of STP, providing additional protection against topology changes that could introduce loops.

Additional details about loop guard functionality and STP interaction can be found in the FortiSwitch administration guides, accessible via Fortinet Documentation.
